T-A Wide-Tire Steel Wheels and Handy Farm Wagons

Each age of our lives has its joys. Old people should be happy, and they will be if Chamberlain's Tablets are taken to strengthen the digestion and keep the bowels regular. These tablets are mild and gentle in their action and especially suited for people of middle age and older. For sale by all de alers.

White Scours or "Diarrhoea" in Calves.

(Continued from page 665)

Such precautions if carefully carried out will prevent the disease on farms where it is not a serious infection.

On farms where the infection has gained a strong hold, prevention is a much more difficult task. On such farms the virulent bacteria are spread throughout the barn and the young calves become infected through the straw or even the dust. At such places it might be possible entirely to isolate the young calves in a new stable where with special attendants and a careful attention to details it might be possible to eradicate the disease. Such methods, however, are usually not practicable.

Dr. C. O. Jensen, Copenhagen, Denmark, has devoted a great amount of time to the study of calf diarrhea. As the result of his work he is able to produce a serum or rather several serums against the different forms of this disease. This serum treatment is now used extensively and with excellent results in Denmark and in many parts of Germany.

The preparation of such serums requires a great amount of labor and care if they are to prove successful. Since there are a number of different strains of both coli and paricoli bacteria which can cause the disease, it is always necessary to examine calves from each farm in order to find out just which strain of these organisms is causing the disease. Then a serum which corresponds to this particular organism must be used. After a serum appropriate for a given form has been obtained it is only necessary to inject a small quantity of this under the skin of the calf. This renders the calf immune to that particular organism and usually no further trouble will be experienced. Dr. Jensen has clearly shown that such methods will both prevent and cure the disease.

It is clear that such serum production can only be undertaken by the different experiment stations. A commercial firm will not ordinarily take the trouble to examine calves from each individual farm. Without such examinations for each farm where the treatment is to be used its success cannot be certain. It would be to the interest of cattle breeders to urge their experiment stations to undertake investigations along these lines.—F. M. Surface in Breeders' Gazette.

How the Orchard and Poultry Plant Were Successfully Built up Together in a New Hampshire Farm.

(continued from page 657)

A small aperture in front to the left of the door is left so that the hens may thrust their heads through for water, which is placed in the iron dishes.

There is another opening in the rear of the house. This is for summer use only, and is closed up during the winter. A little eaves trough of galvanized iron carries what rain water falls on one side of the roof into the drinking dish, thus eliminating the water question except in a time of drought. In late fall and winter before snow comes, boiling water is used as it will not freeze so quickly. Later when snow comes it is given the hens in place of water.

The houses face the south and even in January the fowls do not suffer from disease or cold. The temperature extreme is 20 below, the mean is 30 above during the winter months.

From September until December pullets are purchased to replace the old stock. These are shipped from Maine, New Hampshire, Vermont and Canada, and are sold at 16 to 20 cents per pound.

Twelve pullets are kept in each house. In each there are two roosts extending across the back of the house, a dusting box, two nest boxes filled with sawdust, a dry feed hopper a box with a supply of grit, charcoal and oyster shell. Sand is spread upon the floor every third week. The pullets remain confined in these houses until the following July or August, when they are disposed of. They are sold live-weight in Boston during the Jewish holidays and bring a good price per pound.

The pullets are fed twice daily, at 7 and 3.15. For this work five men are employed and each has more than 100 houses to look after. The grain is distributed with a wagon in galvanized iron tanks, a double set being used and when one set is filled,

Is This Offer Fair?

You do not risk a cent. You must be either delighted with this tea's rich, mellow flavor, or else your dealer wants you to take advantage of this guarantee:—

You have only to return the broken package to get your money back, if you do not like the flavor exceptionally well.

KING COLE'S excellence prompts this offer. The 40c. grade is unusually flavorful. You will surely admit this if you try it.

35c., 40c. and 50c. per lb.

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.

There is not a catch about it anywhere, it's a straight above board business proposition

It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

50 MEN AND WOMEN WANTED TO LEARN THE BARBER TRADE

Short hours, easy occupation, good salaries.

We make you a first class Barber in Eight Weeks.

Tools supplied free. Write for catalogue--- it costs you nothing.

The PATTERSON SYSTEM OF COLLEGES

41 Craig Street, East - - Montreal.
734 Main Street - - St. John, N.B.

empties are returned to be refilled to various points and from these points a wheelbarrow is employed to carry the supplies to each house. Thus snow and rain does not affect the grain. The eggs are gathered once a day when the temperature is 20 degrees above, and when below that point three times daily.

The dry mash or egg-laying formula used is as follows:

500 pounds mixed feed
200 pounds stock feed
300 pounds corn meal
100 pounds American poultry feed
200 pounds beef scraps
100 pounds animal meal
100 pounds cut clover or alfalfa
10 pounds salt.

This mixture of dry mash is kept in a dry feed hopper which is replenished at stated intervals. Whole corn is fed every night save Sunday, when wheat is substituted. The eggs are shipped by express to a commission house in Lowell. The net profit per fowl above the expenses varies from 75 cents to $1.

Five men and two horses are necessary to carry on the poultry plant and at the same time work more or less among the orchards. Most of the pruning is done by the same force, while spraying and harvesting are done by outside help.

In addition to the income from fruit and hens, a considerable amount is received each year from grass sold standing. This grows rank in the larger fields where the older orchards are planted. Thus the total net profit in some years has reached as high as $26,000, while other years it has dropped to $16,000, depending upon the size of the apple crop.

One of the most interesting things about this plant is the legion of A-shaped houses which look like the pitched tents of an army. The work on the plant goes on with the precision of clockwork. Each man is assigned to certain duties which must be performed at stated intervals. All the eggs and live poultry bought and sold, as well as all the grain fed, has to be hauled three miles.

Summer Care of the Dairy Herd.

The supply of water is an important factor in maintaining a milk flow and the health of the dairy herd. such diseases as typhoid may be transmitted from cows to the human family through the use of water from impure and stagnant sources. Unless the pasture is well supplied with fresh running water or water from springs they should have water pumped from deep wells during the dry summer weather. Cows that have to drink impure water fall away in condition rapidly. Water is fully as important as food.

Cows should have shade during the heat of the day. Many argue that cows will give as much milk when confined in a pasture without shade, but humanity dictates that we should make our cows comfortable by protecting them from the direct heat of the sun during the summer weather.

Anything that we may do to alleviate the suffering of the cows during the season when flies are troublesome will be amply repaid us in the increased flow of milk and gains in flesh condition. One pint of blood from each cow daily is the heavy toll demanded by the flies during August and September. Such losses and suffering mean they can return no profit at the pail. In nearly every dairying section flies cut down the receipts of milk from 30 to 40 per cent. during August and September No dairy section can stand such losses. Carefully spraying the cows greatly reduces their suffering during fly time. The following formula has given excellent results wherever it has been used under favorable circumstances.

Fish oil	100 parts
Oil of tar	50 parts
Crude carbolic acid	1 part

The cost of this mixture is about 30 cents a gallon and it may be applied with a hand sprayer every two days. If applied once a day less will be required and better results will be obtained.

Each year adds convincing proof that it is unwise to depend on pastures alone to sustain the dairy herd during the summer.

It is imperative that we plan some means of carrying the cows over the time when pastures are failing. A steady flow of milk and growth of young animals can only be obtaioed by supplying additional food as soon as the pasture shows signs of failing. Supplying supplimeneary feeds early makes tne change more gradual and at the same time insures us against a loss of milk flow and condition. We must supply green feed to the cows during this critical period. It is a waste of grain to feed it to cows that do not have an abundant supply of palatable and nutritious roughage A drouth-stricken pasture does not furnish this. It is not necessary to plan an extensive system of supplemental crops to feed the cows during this period. Clover, alfalfa, oats and peas and corn that are grown in the regular rotation practiced on the best dairy farms make excellent supplemental feeds (in case ensilage is not available) and they are the very best of feeds to cut and feed green.

To Prevent Tools From Rusting.

Any steel tool will rust if exposed to damp air, yet I found that tools subjected to the following treatment every three months will not rust unless actually thrown on the ground or exposed to hard rain.

Take two parts each of graphite and tallow and one part gum camphor; melt together, and if not soft enough to form a stiff paste, add more tallow or lard. Remove all rust from the steel surface, wipe dry, and apply the paste. Let it remain on for 24 hours, then rub dry. Unless the tool is needed, even longer than one day will be still better for the tool to be covered with the preparation.

The above preparation has the effect of a coating of oil though every vestige has apparently been removed for months.

M-L FLAT-WALL COLORS

HELP TO DECORATE YOUR ENTIRE HOME FREE

Write us to-day on the coupon for the "Wall Beautiful and Hygienic." It helps you to decorate your home in rich, mellow color that just suits each room. We give you expert help FREE in selecting these charming colors to show your home at its best. Send to us to-day.

DECORATIVE advice of the right kind is hard to get. It costs you a great deal of money to employ an expert. But we will give you the special advice and color scheme each individual home needs without a cent of cost. The color effects will be as good as an expert's work. This is your chance to have one of the most beautiful color schemes for your home, free. Send the coupon below to-day. It will bring you news, too, about M-L Flat Wall Colors, and where to get them.

M-L Flat Wall Colors are something new in oil paints for plaster or woodwork, in dainty, rich effects. They don't shine or glitter, but are restfully dull. You can wash them with soap and water, and they don't spot. Quite unlike kalsomine or water washes and finishes. They resemble expensive dull finish enamels, but can be applied perfectly by anyone. Usually, decorative advice costs a great deal. We tell you, free, how to decorate your home in the right shades of M-L Flat Wall Color, but your only expense is for the colors alone—very moderate cost. Write us to-day on the coupon. Send this coupon now.

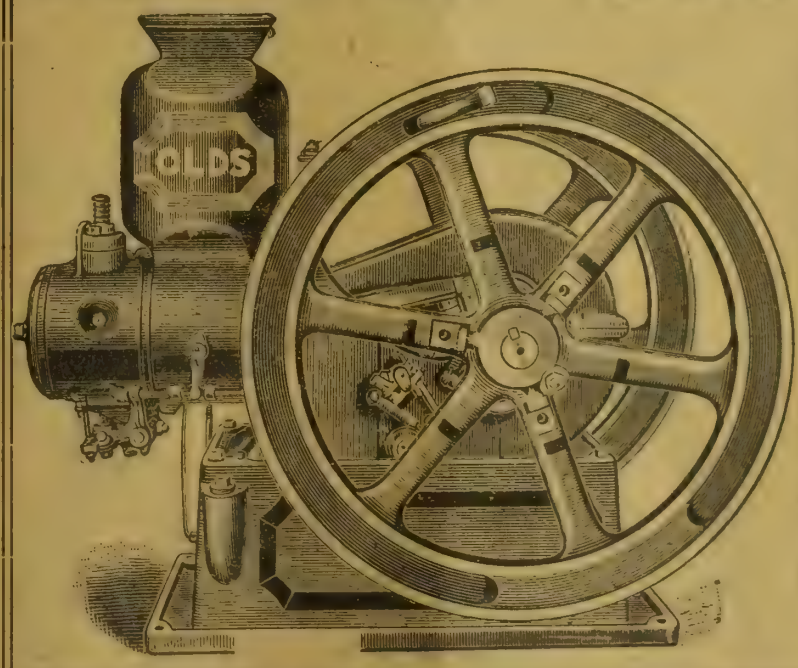
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole Sale Representatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited
Moncton, New Brunswick.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

POULTRY—All varieties. Send for Catalogue. Box 485, Moncton, N. B.

DAIRY PRODUCTS—Creamery Butter, Solids 24½c. to 25c.; Prints, 25c. to 26c.; Dairy Butter, 18c. to 20c.; Cheese, 12½c. Board price.

POULTRY AND POULTRY PRODUCTS—Eggs, 18c.; Fowl, 10c. to 16c

FRUIT—Apples, $3.00 to $4.00 per bbl.

MICELLANEOUS—Hay, $13.00 to $13.50; Straw, $6.00 to $7.00; Wool, 21c.; Calf Skins, 12c. to 14c.; Beef Hides, 10c.; Lamb Skins, 15c. to 25c.; Sheep Skins, Wool off 15c. to 25 c.

VEGETABLES— Potatoes, 40c.; Turnips 20c. to 25c.

Since last report market has remained steady in most lines, potatoes are lower, also lower prices for butter which is offering pretty freely. Eggs are steady at 18c. now and the the supply will be getting smaller and quality not so good. We do not know what to expect but do not look for very much change. This was our first cheese board meeting and about 950 boxes were offered on the board which sold at 12½c. The cold wet weather of the past two weeks has kept the growing crops almost at a standstill and things do not look as good as we had hoped to see them from prospects of two weeks ago, still with a spell of good warm weather the loss may be overcome and everything come out all right. Good beef cattle are reported very scarce.

St. John.

DRESSED MEATS—Beef (carcass), 10c. to 13c.; Beef (retail), 12c. to 24c.; Mutton, 8c. to 10c.; Veal, 9c. to 11c.; Pork, 10½c. to 11½c.

DAIRY PRODUCTS—Creamery Butter, 21c. to 25c.; Dairy Butter, 20c. to 23c.; Cheese, 13c. to 14c.

POULTRY AND POULTRY PRODUCTS—Eggs, 19c. to 22c.; Fowl, $1.25 or 22c. lb.; Chickens, $1.50 to $1.75; Ducks, $1.50 to $2.00; Turkeys, 20c. to 23c. lb.

MISCELLANEOUS—Wool, 14c. to 22c.; Beef Hides, 11½c.; Calf Skins, 18c.; Lamb Skins, 15c. a piece; Sheep Skins, 75c. to $1.00.

Buctouche, N. S

Offers for prompt sale:—
1 Holstein bull 3 years old.
1 Holstein bull 16 months old.
2 Holstein bulls 7 months old.
1 Holstein Heifer 7 months old.
All from good milking strain and prize winning stock. Must be sold early to make room for new stock.

Orpingtons,

In Buff, Black and White.

At the Winter Fair in Amherst won 2nd Buff Cock, 1st pair Utility Pullets in the hottest kind of competition. In Whites, 1st Cock, 3rd hen. In Blacks, I made a clean sweep, winning also at Halifax, New Glasgow and Pictou. Stock and eggs for sale.

C. H. Wisener, Pictou, N. S.

FOR SALE

A valuable set of Veterinary Formulas by a noted English Physician and Veterinary Surgeon, including the celebrated English Medicated Stock Food, Poultry Food, Liniment, Cough and Cold Cure, Spavin Cure, Heave Cure, Scratch Cure, Corn Cure, Condition Powder, Healing Salve, Hoof Ointment and Disinfectant.

These Remedies are absolutely reliable, registered under the Pure Food and Drugs act and they will save you 75 cents on the Dollar.

$10 takes them. Money refunded if not as represented. Address

Reduced Prices for Balance of Season

on Strawberry and Raspberry plants, also half price on Utility Barred Plymouth Rock and Fancy Columbian Wyandotte Eggs for hatching.

Orchard Hill Farm,
Brown's Flats,

Shorthorn Bulls for Sale.

We have ten Roan and Red Bulls from 10 to 14 months old, of splendid form and very desirable. Would be glad to supply Societies or private individuals.

C. C. H. EATON,
Canard, N. S.

YORKSHIRE PIGS.

No Jerseys for sale at present. We have three litters of Yorkshire pigs, five weeks old for sale. Price five dollars, registered.

JOSSELYN & YOUNG, St. John, N. B.

EGGS FOR HATCHING.

Now is the time to look ahead and look spry. Eggs for hatching from Barred P. Rocks, White Rocks, R. C. Reds, Buff Orpingtons and Imperial Pekin Ducks $1.00 per setting, all orders booked ahead and shipped in rotation.

EGBERT DEYOUNG,
Box 120 Dartmouth, N. S.

Eggs For Hatching.

More winners in our pens of B. P. Rocks, than in any others of this variety east of Montreal. We have been in comptition with the best and more than held our own. Eggs are one quarter the price of imported stock and issue every time ahead. Inquiries as to prices solicited.

Craig Bros., Amherst, N S.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

4½% For Your Money

Why leave money on deposit in the bank at 3 p.c. when you get half as much more by buying municipal bonds with it? We can sell you town bonds of New Glasgow, Dartmouth or any one of a dozen towns in the Maritime Provinces, to yield 4 1-2 p.c. or better. Send for particulars as to how to make your savings earn more.

"I want to Tell You a Big Secret of Building"

DEAR FRIEND:

I am sitting here at my desk, thinking how I shall write many people. I am an old man now—70 years old. 50 long years of my life were given over to making a perfect roof for any kind of building (for everybody has to use roofs), and the right roof works day and night to help a man's daily work.

A roof on a building is the weak link in a chain. Good foundations and good timbers rot—good products stored under a poor roof are spoiled because the roof doesn't protect. I want to stop that big waste. After years of work, I now know how to do it.

I worked for a long time to get a roof that could be easily laid by anybody. It had to be neither too heavy nor too light. It had to be smooth and clean. It had to be a real water shedder, no matter how long it was laid. It had to be proof against ice, snow, lightning sun and time.

My Oshawa Shingles are the result. I worked for years to find a metal that wouldn't rust. I worked on an iceproof lockjoint. I have a shingle to-day that is the best ever put on the market. People buy it from me all around the world, it is so good. These people see how worth-while a good roof is.

I know my Oshawa Metal Shingles so well, and anybody can lay a roof in them so well and easily, that it makes the safest and best roof you can get. But I have a new 100-year metal now. My Oshawa Shingle is perfected. A 100-year roof is a mighty good article—far better than even old style, hand-shaved cedar shingles. I know my roof is four times as good---and it won't burn.

Not only that---when you get a roof, get the best you can find. Here is a fireproof and lightning proof protection for you for a century. Yet the roof costs a common every-day price.

My "Roofing Right" book, No. 153, lets you dig down into my Oshawa Shingle proposition. I want you to send for it. You can get all the facts. Even if you do not use my roof this book is worth money

because it gives valuable building hints. My Oshawa Shingles are on the best and most modern buildings. These are pictured in the book. You can get it for a post-card. Send that card to-day. My book, No. 153, will help you in your plans.

The best way is to write my nearest office instead of direct to me. This plan will save you trouble and time. I want to help you in every way.

Yours truly,

G. A. Pedlar

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

THE Keeley Cure

Positively Cures Alcoholic Inebriety, Opium, Cocaine and Other Drug Addictions

IF YOU MUST DRINK

before you can do business, if you have that feeling that you cannot eat, sleep or concentrate your mind on your work until you have a drink of liquor, you are not normal. And if abnormal, you are diseased. You are a victim of the disease of inebriety. This does not necessarily mean that you are often carried home drunk, or even that you stagger, but it means that your nerve cells have been created and have lived under the influence of alcohol until they cannot perform their functions naturally and painlessly except under its influence, and because your nerve cells are not performing their functions—your mind is sluggish, you concentrate your thoughts with difficulty and forget things you should remember, you are subject to attacks of melancholia and depression, when anything goes wrong, you probably have a capricious appetite and what you eat is not well digested. You suffer extreme nervousness and many other symptoms of the disease.

Now, the Keeley treatment cures inebriety by restoring the nerve cells to a healthy condition, toning up the whole nervous system. All craving or feeling of necessity for stimulants disappears because normal, healthy nerve cells do not need artifical stimulation. They are able to perform their functions without it. The improved conditions are evidenced by the return of a normal appetite, renewed mental activity and quiet, restful sleep, a disposition to settle down to the proper kind of life, to enjoy one's home and family, and live a life of contentment and happiness.

The methods and treatment are without shock, inconvenience or harmful tendencies, and the patient passes from the addiction to a cure so easily and comfortably that he hardly realizes that he is the subject of medical treatment.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain and makes a man out of a nervous wreck.

Patients are not confined; there is no irritating or vexatious restraint.

There is no Nausea or other Sicknesses attendant upon or caused by our treatment. Improvement begins at once and continues throughout entire course of treatment.

We have special accommodations for ladies, where they can be entirely exclusive, and can be treated as privately as in their own homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated as strictly confidential.

DE LAVAL
CREAM SEPARATORS

Best Time To Buy One

There never was a better, if indeed as good, a time to buy a DE LAVAL Cream Separator than **right now.**

The hot weather is at hand when the use of the cream separator frequently means most as to quantity and quality of product, while cream and butter prices are so very high that waste of quantity or poorness of quality means even more now than ever before.

This is likewise the season when DE LAVAL superiority is greatest over other separators,—in capacity, ease of running, sanitary cleanliness and every other way.

Cost need not be a consideration because a DE LAVAL cream separator is not only the best of all farm investments but may be bought either for cash or on such liberal terms as to actually pay for itself.

There never was a better time than right now to buy a cream separator and there can be no possible excuse for any man having use for a separator delaying the purchase of one at this time.

Look up the nearest DE LAVAL agent **at once** or if you don't know him write us directly.

Poisoning the Potato Beetle Effectively.

Apply Arsenical With Bordeaux

F. H. HALL, Geneva, N. Y.

SINCE the advent of the Colorado potato beetle some thirty years ago it has usually been almost impossible to raise a good crop of potatoes in some sections of the East without a vigorous campaign against this insect. On small areas, or on larger ones in especially favorable years, hand picking may keep the "bugs" in check; but usually on large fields the labor cost of hand picking is prohibitive and poison must be used. For this purpose paris green was for years the one remedy recommended; and though other arsenicals have recently taken its place to a limited extent it is still the main standby of the potato grower.

ARSENICALS OCCASIONALLY INJURIOUS.

Now, soluble arsenic is almost as harmful to plants as to animals or insects; and since paris green always contains a small percentage of arsenic not completely combined with a base, and may contain, when not properly made, a considerable proportion of such soluble material, it is not surprising that it has occasionally burned the foliage of the potato plants to which it was applied.

The leading authorities have for years recommended that this and other arsenical poisons be used in lime water, or, better, in bordeaux mixture, so that any soluble arsenious acid might combine with the lime and thus become harmless to foliage. But many growers still continue to dust on the poison or to sprinkle it on mixed with water alone; and such users sometimes suffer from burned foliage. For this reason there has, lately, been considerable complaint about paris green and much hesitancy about applying it to potatoes. The advocates of certain non-arsenical "potato bug" destroyers have not been slow to use the results of wrong application of paris green as arguments against its use at all.

PARIS GREEN SAFE WHEN PROPERLY USED.

But if injury from misuse were to prevent all use of materials, we would be obliged to discard many valuable agents. If paris green and other arsenicals are injurious only under certain conditions we should learn to control the conditions, not discard the poisons; for these materials are far cheaper than the non-arsenical substitutes proposed for them.

To ascertain to what extent paris green is injurious to potato foliage, how the injury is caused and under what conditions it occurs, a careful test was made at the Station in 1904. The results were surprising in several ways. There was no injury from the paris green, however applied; and the poison was found to have considerable power as a fungicide as well. That is, the rows on which paris green was used suffered much less from late blight than did check rows from which the bugs were picked by hand, and gave much larger yields.

METHODS OF APPLYING PARIS GREEN.

The dry, or powder gun, method of applying paris green is inexpensive, but it is not considered as effectual as spray treatment, so it was not included in the test. The poison was applied in water, in lime water and bordeaux mixture, the rows thus treated lying side by side; while a row on one side was left unsprayed as a check, and a row on the other side was sprayed with bordeaux mixture only, these two rows being kept free from bugs by hand picking. This series of five rows was repeated five times so that each treatment was used on one-tenth of an acre of potatoes.

The plants were sprayed five times between July 7 and August 25, the spraying being done very thoroughly with a knapsack sprayer, going out at one side of a row and back the other.

Poison was omitted at the last treatment as the foliage of the rows not treated with bordeaux was so badly injured by blight at that time that no paris green injury could have been detected. One pound of the poison was used to each 50 gals. of liquid. The paris green was analyzed in the Chemical Laboratory and found to be of good average quality, well representing the material generally found in market in the State. The amount of spraying liquid applied varied from 125 gals. at the first treatment to 225 gals. at the fourth. This gave from 2 1-2 to 4 1-2 lbs. of paris green to the acre at each application, and a total during the season of 12 lbs. to the acre. In the lime-water mixture, 2 lbs. of freshly slaked lime was used for each 50 gals. of water. The bordeaux was made by the usual 6-4-50 formula (1-to-8 strength) except in one spraying when 6 lbs. of lime was unintentionally used instead of 4 lbs. The poison was added to the bordeaux without using any more lime.

RESULTS OF TEST.

The potato beetles were perfectly controlled on all the rows. As already stated, there was no evidence of foliage burning by the paris green, not even when the poison was used in water alone and at the rate of 4 1-2 lbs. to the acre. On the contrary, all through the season the foliage on the two rows sprayed with poison in water and in lime-water was noticeably more free from blight, more perfect, greener and more vigorous than that on adjoining check rows from which the bugs were picked by hand. It was quite evident that the paris green was aiding the plants to resist blight, though of course to a less extent than did the bordeaux mixture on the other

Bee Hives on Beabody Bros. Farm, Woodstock, N. B.

two rows of each series. There was no noticeable difference between the foliage of rows on which lime was used and those on which the poison was used in water alone; nor was there any contrast between the bordeaux-sprayed rows, with and without paris green.

Digging time, however, brought out more strongly the advantage of the paris green; and indicated that its fungicidal value was not all obscured even when it was used with bordeaux. Surprising differences were also shown between the rows where lime was used with the poison and where poison was used alone, which seem unfavorable to the use of lime. These differences were constant throughout the series, but are too small to overturn previously held views without more evidence. The average yields are shown below:

YIELD BY SERIES IN THE PARIS GREEN EXPERIMENT.

Series.	Rows.	Treatment	Yield of marketable tubers per acre.	
			Bu.	lbs.
I	1, 6 and 21.	Check; not sprayed; bugs hand picked.	175	—
II	2, 7, 17 and 22.	Paris green in water, four times.	221	9
III	3, 18 and 23.	Paris green in lime water, four times.	208	53
IV	4, 19 and 24.	Paris green in bordeaux four times and bordeaux alone once.	165	—
V	5, 20 and 25.	Bordeaux alone, five times; bugs hand picked.	317	30

Paris green in water increased the yield 46 bu, 9 lbs per acre.
" " " lime water increased the yield 33 bu. 53 lbs. per acre.
" " with bordeaux increased the yield 150 bu. per acre.
Bordeaux alone increased the yield 142 bu. 30 lbs. per acre.

Paris green in this experiment certainly was not injurious to the plants, as its use in water increased the yield 46 bu. to the acre, almost one-third as much as did the bordeaux mixture; while its use with bordeaux increased the yield over that where bordeaux only was used, by a small, but constant quantity. The surprising feature, that the use of lime with paris green apparently lowered the yield, may possibly be explained in this way. Though conditions of weather—rain, sunshine, etc.—appeared favorable to development of foliage-burning, none occured; so there was no chance for lime to exert a favorable influence; and its presence may have interfered slightly with the fungicidal action which the experiment proves paris green to have.

While the test strengthens the view heretofore strongly advocated by this Station, that bordeaux should always be used as a carrier for paris green on potatoes, it does not cause us to change the advice to use lime with paris green if the grower is determined to apply only the insecticide. If all conditions had been right to produce burning, it is quite certain that the use of lime would have shown a benefit.

ARSENITE OF LIME.

A comparatively recent addition to the list of insecticides is arsenite of lime, or arsenite of soda in lime water which forms the same compound. The basis of this is white arsenic, a more soluble arsenic compound than paris green and therefore one which it would be entirely unsafe to use in its original form. But by boiling with lime, or better by boiling with soda and adding the resulting solution to lime water, an insoluble compound is formed which is cheaper than paris green, which remains in suspension better and which is a most effective insecticide.

Unless very carefully prepared, however, this arsenite of lime (or arsenite of soda) is quite liable to burn foliage. It was tested at the Station in an experiment similar to that with paris green though only four rows were necessary in each series since there could be no question about using the poison in water alone. Such treatment would mean the death of every plant sprayed.

PREPARATION OF ARSENITE OF LIME.

Rows in each series were, in order, unsprayed, sprayed with arsenite of lime water, sprayed with arsenite in bordeaux, and sprayed with bordeaux only. The bugs on the check row and that sprayed with bordeaux only were picked by hand.

The stock solution of arsenite of lime was prepared by the Kedzie formula:

White arsenic ..... 2 pounds.
Sal soda (washing soda) 8 pounds.
Water ..... 2 gallons.

Boil 15 minutes or until the arsenic dissolves, leaving only a small quantity of muddy sediment. Replace the water lost in boiling. This makes a stock solution of arsenite of soda which may be placed in tightly stoppered jugs and kept on hand for use is needed. In preparing the spray mixture use two pounds of freshly-slaked lime with each pint of the stock solution in the desired quantity of water or bordeaux mixture. The arsenic of soda and the lime unite to form arsenite of lime. The arsenite in one pint of the stock solution is equivalent to four ounces of paris green.

In different sprayings the quantity used varied from two to four pints in 50 gals. of liquid, and the amount of liquid from 100 to 225 gals. to the acre.

RESULTS.

Within a week after the first application a heavy rain fell. On the day following it was noticed that considerable burning of the foliage had occurred where the arsenite was used in lime water; but none where it was used in bordeaux. Similar injury occurred after the second and fourth sprayings; but after the third, perhaps because there was less rain, no injury was noticed. After the second spraying the injury was marked, leaves of all ages being affected with large copper-colored dead spots, some of them closely resembling the spots of late blight. A photograph of a healthy plant and one injured by the arsenite is reproduced on the title page. There was no sign of burning on the bordeaux-arsenite rows at any time. By the time of the fifth spraying the check row and that sprayed with arsenite in lime water were practically all dead, so only the bordeaux sprayed rows were treated.

At harvest, the yields were as follows:

YIELD BY SERIES IN THE ARSENITE OF LIME EXPERIMENT.

Series.	Rows.	Treatment.	Yield of marketable tubers per acre.	
			Bu	lbs.
I	1, 5, 9, 13 and 17	Check; not sprayed; bugs hand picked.	142	25
II	2, 6, 10, 14 and 18	Sprayed 4 times, arsenite of soda in lime water	94	15
III	3, 7, 11, 15 and 19.	Sprayed 4 times with arsenite of soda in bordeaux and once with bordeaux alone.	295	45
IV	4, 8, 12, 16 and 20.	Sprayed 5 times with bordeaux alone; bugs hand picked.	329	45

Arsenite of soda in lime water reduced the yield 47 2-3 bu. per acre.
Arsenite of soda with bordeaux increased the yield 153 1-3 bu. per acre.
Bordeaux alone increased the yield 187 1-3 bu. per acre.

From this test it is quite evident that the arsenite of soda in lime water is unsafe to use on potatoes, even when, as in the first and second sprayings, the actual amount of arsenic contained is only half as great as in the paris green which was used without harm in lime water in the other experiment.

The figures would also indicate that the arsenite is injurious, even in the bordeaux mixture; for there were more potatoes where bordeaux was used alone. But there was no evidence of foliage injury on the bordeaux-arsenite sprayed rows; so the difference in yield may have been to quite an extent accidental.

It is safe to say that whatever arsenical is used it is safest and best to apply it with bordeaux.

Bacteria Affecting Milk and Cream.

By W. F. Droge, Deputy Daiay Commissioner, Manhattan, Kansas.

Bacteria are very small one-celled organisms, so small that they can be seen only with a high-power microscope. These organisms are present in almost every nook and crevice in the world, from the top of snow-capped mountains to the bottom of the seaf They are found in the soil, in the air, and in our food. They are very abundant in milk and cream.

The terms "bacteria, "bacilli," "germs," and "microbes" are practically synonymous. The word "bacteria" suggests to the average person such organisms as produce disease. A graet many bacteria do produce disease, but a large proportion of them do not. However, most of the latter class are objectionable. Milk is an excellent food for bacterial growth, and nearly all types find it a good place in which to thrive.

TYPES OF BACTERIA WHICH DO NOT PRODUCE DISEASE.

LACTIC ACID BACTERIA.—Under this type of organism come all those varieties which act upon the milk sugar by changing it to lactic acid. This acid causes the milk to become sour much as when vinegar, lemon juice, or other sour substances are added to milk. When enough of these acids are added, the milk will curdle, and this same action takes place when the bacteria produce lactic acid. Acid is the only substance which will directly sour milk and cream. The lactic acid bacteria cause the natural souring of milk. These types gain entrance from various sources. They are found in the teats and udders and on the hair and skin of cows, on the hands and clothing of milkers, and in water, hay and manure. Milk is the natural habitation of these bacteria; and if it is kept at a temperature suitable to them, they will increase in numbers very rapidly.

The common milk-souring bacteria thrive best at about 78 degs. to 80 degs. F., while most of the disease producing organisms grow best at blood temperature, or about 98 degs. F.

There are several varieties of bacteria which produce gas in milk and cream:

BACILLUS COLI COMMUNIS.—A common gas producer is the bacillus coli, the organism commonly found in the colon of the intestines of man and animals. When a large number of these organisms are found in milk, it indicates contamination with animal feces or stable manure. These bacteria are often the cause of bad flavors and foul odors.

BACTERIUM AEROGENES. The bacterium lactis aerogenes belongs to the lactic acid group, but it produces both acid and gas. It is the organism that causes the gas spaces in cheese curd.

BACTERIA CHANGES IN MILK AND CREAM.

When milk or cream is kept at a temperature of about 80 degrees F., the number of acid bacteria increases very rapidly, and so much acid is produced that in a short time the milk will become sour. The number of bacteria increases as the acid increases until a certain per cent (about .7 per cent) is reached. Here the acid becomes so strong that it kills the lactic acid bacteria, and types which are more reticent to acid will predominate. These are mostly putrefactive bacteria or those which putrefy the proteids.

The putrefactive bacteria in milk belong to the same class as, and many are identical with, those which cause the decay of meat when it is exposed to the air.

BACTERIA PRODUCING ABNORMAL CONDITIONS IN MILK.

Slimy or ropy milk is caused by an organism which produces a gelatinous substance. Milk so affected can be drawn out in long threads. Its occurrence is usually in milk over twenty-four hours old.

The source of this organism may be the wash-water, the rinse-water, or particles of dirt or dust. When it once gets into a can of milk, it is easily transferred to other cans and

The organism thought to cause fishy flavor in butter. (It is on the border line between a bacterium and a mold.)

unless proper precautions are taken and all utensils are thoroughly cleaned and scalded, it may cause a great deal of trouble and financial loss.

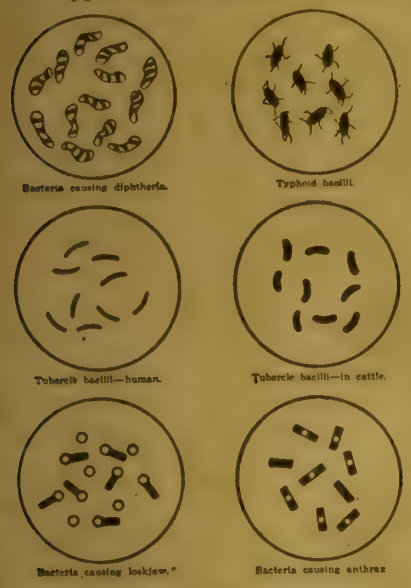
Bitter milk is caused chiefly by bitter weeds eaten by cows, but is occasionally caused by bacteria.

Soapy and colored milk is caused by certain undesirable kinds of bacteria whose occurrence in this country is rare.

Yeasts are often a great source of trouble, especially in old cream. They can easily be detected, as they produce a large amount of gas, causing the cream to swell and give off odors similar to those that rise from sour bread dough.

Molds are abundant in old cream that has been handled and kept in damp, musty rooms, cellars ot caves.

A type called oidium lactis is thought to be the cause of fishy flavor in butter.



Bacteria Dangerous to Human Life.

DISEASE-PRODUCING BACTERIA.

Among the disease-producing bacteria commonly found in milk or cream are those causing tuberculosis, diptheria, typhoid fever, and foot-and-mouth disease. Less common are those causing cholera, lockjaw and anthrax. All these usually gain access to the milk from diseased animals or their attendants and milkers. One person or animal may spread the disease throughout a whole community. Every precaution should be taken in preventing diseased persons or animals from coming in contact with others, and milk from such animals should not be used for any purpose whatever unless itis boiled; even then it should be fed only to stock. When an epidemic breaks out among cattle, notify the State Live Stock Sanitary Board, Topeka, Kan.

TUBERCULOSIS.—Tuberculosis is one of the most serious diseases which confronts the dairyman. It has been rapidly increasing for the last twenty-five years, both in cattle and in the human race. It is widely distributed, but is more prominent in countries that have long been settled and are thickly populated.

Among the human diseases there is only one other, pneumonia, that claims more victims than tuberculosis, but as this takes only persons of low vitality, usually the very young and the very old, it is not of so much economic importance as tuberculosis. Tuberculosis claims mostly men and women of middle age.

In 1910 more people in the United States died from tuberculosis than were killed during the four years of the Civil War. In spite of all our modern methods of prevention, this dreadful disease is steadily increasing. One out of every seven deaths is caused by tuberculosis.

In cattle the disease is more virulent than in man; and where once it gets a foothold, it is apt to run through the whole herd.

There has been much dispute about whether or not tuberculosis from cattle is transmitted to human beings, but the probability of such transmission is now conceded.

The bacterium of tuberculosis is a small rod-shaped organism. When it attacks animal tissues, it forms little masses of cheesy or wax-like yellow tubercles. When a lung or other infected organ is examined, these little tubercles can be plainly seen. The lungs and air passages are most commonly affected but other organs, as the spleen, the kidneys, and sometimes the milk ducts and udder are also affected. When the disease is located in the udder, the milk is dangerous as an article of food.

The examination of milk for tubercle bacilli does not always show that the animal is infected, and the only sure and practical method is by the tuberculin test. This should be performed by a competent veterinarian.

TYPHOID FEVER.—Typhoid fever is often spread by the use of infected milk. Cows do not have this disease but the milk, after being drawn, becomes infected, usually from persons who milk the cows or otherwise handle the milk, or from wash-water which is infected. It may also be carried to and from the daity in empty bottles or vessels. Such containers should all be scalded before being used.

DIPTHERIA is a serious and often fatal disease among children. Many cases of diptheria have been attributed to the milk supply. A diptheria patient may recover from the disease but still carry the organism in the throat. If such a person is allowed to handle milk, the disease may be easily transmitted to others. A convalescent from diptheria should keep away from places where milk and cream are handled until he is certain that he is free from the organism.

SCARLET FEVER is another disease often spread by the use of infected milk. Although not so fatal as diptheria,its relation to milk is about the same. The organism has not yet been found, but the disease is very contagious and easily transmitted.

DISEASES OF THE INTESTINAL TRACT. The death rate in the human race is the greatest among children under one year old, and the majority of these deaths are due to disorders of the intestines. There are many causes for such disorders, but much can be attributed to milk, as it is the principal food fed to infants. Dysentery, diarrhoea, cholera morbus, and summer complaint are usually caused by bacteria which get into the body with the milk. Too great care can not be taken in the production of milk for babies.

DISEASE GERMS LESS COMMON IN MILK.—Such diseases as lockjaw, anthrax, and foot-and-mouth diseases are very rare, but, when they do occur, they are violent and fatal. Although transmitted through milk, these diseases can usually be detected in the animals before infected milk is consumed.

The following table will show the number of bacteria to the drop found in a sample of average milk kept at room temperature and tested at various times:

First test 7,650 bacteria a drop.
1 hour later 26,950 bacteria a drop.
2 hours later 30,300 bacteria a drop.
4 hours later 34,000 bacteria a drop
7 hours later 50 100 bacteria a drop.
9 hours later 102,000 bacteria a drop
25 hours later 425,000 bacteria a drop.

HOW TO CONTROL BACTERIA IN MILK AND CREAM.

STERILIZATION.—This is the practice of subjecting milk to a high degree of heat, at least the boiling point. The heating may have to be repeated for three consecutive days to kill all bacteria and their spores, it must be repeated a sufficient number of times for the accomplishment of the desired result.

Sterilization is not satisfactory on a commercial scale, as the boiling of milk coagulates the albumin and renders it hard to digest.

PASTEURIZATION. This is the practice of subjecting milk to a temperature of from 140 degrees to 180 degrees F. for a few minutes and immediately cooling it. This method

Bacteria Causing Changes in Miik.

destroys most of the common types of bacteria and especially the lactic acid bacteria, but it kills neither the spores nor all the bacteria of the objectionable or harmful types. The chief objection to the pasteurization of milk is that such milk is apt to be kept too long, and that thus the harmful types of bacteria, although they have no apparent effect upon the milk, will increase in such numbers as to render the milk dangerous. The tubercle bacillus, however, is killed by efficient pasteurization.

The safest and most practical method of controlling bacteria is by producing milk under sanitary conditions and immediately cooling it and keeping it cool.

The Farm Homestead Water Supply.

By Frank T. Shutt, M. A., F. I. C.,
Dominion Chemist, Ottawa.

There seems to be a little necessity now-a-days to emphasize the vital importance of a pure water supply for our cities and towns. Thanks to the investigations of the chemist and bacteriologist and the collection of civic statistics during the last three decades, an intimate relationship between the quality or, more correctly speaking, the purity of the water supply and health has been firmly established and this relationship, thanks to the many and various ways we have in these days of easy publicity, has in a very general way been recognized by our citizens. The fact that outbreaks of typhoid fever in our large centres have, in many instances, been directly and indisputably traced to a common source—a polluted water supply—has served to win this general admission and made it comparatively easy for the authorities of our cities and towns to obtain large sums of money to procure an ample supply of wholesome, disease-germ-free water. And we further find in our more enlightened centres that the expenditure for the systematic, periodic, scientific examination of the supply is considered a very wise one. In this matter of what I call the scientific control of the water supply, I think this Association may do useful service by impressing upon our people and civic authorities that pure supplies may at any time, by accident or otherwise, become contaminated and that without a careful, systematic watch such contamination may remain unknown until too late—until the epidemic that will eventually follow is upon the citizens. My experience leads me to put great emphasis upon this phase of the question. If such a course had been in force there can be little doubt but that many severe typhoid fever epidemics in our cities and towns might have been prevented.

But my purpose to-day is to speak of the water supply of the farm homestead, a matter to which as chemist of the Dominion Experimental Farms, I have given considerable attention during the past twenty-five years. And first I have to remark upon the general apathy among the rank and file of our farmers towards this question. It has been quite a different matter to arouse in our rural districts anything like the keen interest that is evinced by the inhabitants of cities and towns. In spite of lectures, bulletins and propaganda of various sorts our farmers as a class, are not yet fully alive to the value of unpolluted water for themselves and their families, for the health and thrift of their stock and the quality and wholesomeness of their dairy produce. Nor do they realize how easily and frequently certain forms of disease—diseases by no means uncommon in the country—are contracted by the use of a polluted drinking water. Perhaps this is not altogether to be wondered at, for hitherto the farmer's mind has moved slowly in learning and appropriating the teachings of science and the attitude "what was good enough for my father is good enough for me" is still to be found among those who are tilling the land. I would not, however, leave this phase of the question without recording a much brighter outlook lor reform than existed twenty years ago. The good work of disseminating information is having its effect and the younger farmers, more especially, are looking more closely into the character of the water supply. Instances are becoming more numerous every year of farmers going to considerable expense to secure a good and ample supply—a supply beyond suspicion—and piping it for use in the farm house and for the watering of their stock. Hand in hand with this there is the putting in of a bathroom and the adoption of the septic tank system for the disposal of the household sewage. This is an encouraging sign of the times. I

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

CHILDEN'S VIEWS ON ROADS.

Many an adult called upon to prepare a thesis on "What Good Roads Mean to Canada" would find himself nonplussed. He would know perhaps, in a vague indefinite way that Good Roads would mean much for this country, that it would make for its betterment socially, its advancement commercially, and its rapid development. He would understand that Good Roads would bring in a large influx of tourists, and decrease the cost of living. But if requested to state these facts in a clear, logical manner, and to draw deductions aud conclusions therefrom, the average man would confess his inability to prepare a satisfactory paper.

And yet this is just what nearly five hundred of Canada's school children have done. The Canadian Highway Association some time ago, offered valuable prizes for the best essays on "What Good Roads mean to Canada". Evidently this was a popular subject, for students from all parts of the Dominion sent papers to the headquarters of the association in New Westminster, including essays so carefully prepared that the judges took over two weeks to decide the three prize winners.

This nducement to the children to study the question of better roads is commendable in every way, and it is gratifying that this first propaganda among the young people has met with such signal success.

In their report, the judges mention the thoroughness with which the children treated the subject, for instance the stress the children placed upon the social aspect. Canada, perhaps unconciously, is striving for a higher moral plane, and the children recognize the factor that Good Roads would be in this. The boy of today is the man of tomorrow. The Good Roads question will not be settled in this or the next decade, and the study of the subject which the preparation of these essays has involved on the part of the young people will inculcate in them a desire for better roads, which will not be eradicated by the passing of time. Some day some of the children whose essays have just given the Westminster judges such a trying time will be occupying high places in this Dominion. Some will be reeves or councillors of municipalities: some will be members of Parliament; one may be a Premier of Canada.

Because of this study of the question in their youth, they will have a truer, clearer knowledge of conditions than could otherwise have been the case, and the result of their study in 1912 will make for the benefit and the betterment of their communities ten or twenty years hence.

The Canadian Highway Association has already accomplished much commendable work, but it is doubtful if its propaganda and its deputations to parliament will have done as much to awaken the public conscience as this offer of medals to the children of Canada. The Gold Medal essay in this competition appears on another page of this issue.

SELF-RELIANCE.

The farm is the greatest training schoolin the world for self-reliant men. The farmer and the farmer's sons simply have to do things themselves. There is nobody else around to do them. The farm boy early in life learns to do things, and if he can't accomplish the thing which has to be done one way he casts about for another until he finds out how to do it. This makes him resourceful. It develops in him the ability to find a way out of the difficulties about him. This training follows him all through life, and for this reason he is more apt to be able to take care of himself in almost any situation than the man who has never had to rely on himself. It is this sort of thing which develops manhood. Unfortunate is the boy who is surrounded by luxury conveniences and wealth, for he has little opportunity to learn to depend upon himself.

The Journal of the American Medical Association refers to the actual physical weakness and moral weakness which is the natural result where no exertion is required and points out that the individual or species for which things are made easy loses those functions which they do not make use of. This journal says: "It has often been observed that living organisms require for their fullest development a certain amount of resistance in their environment. The individual or the species for which things are made too easy loses the unused function. The butterfly helped from its chrysalis has imperfect wings; the man fed on soft food has bad teeth. The parasite is always a degenerate monster. The parasite dodder, which draws all its sustenance from the sap of its host, is a plant without a root or a leaf. The hermit crab, which instead of growing a shell for itself like other crustaceans, makes use of the cast off shells of mollusks, is atrophied in some of its members and enfeebled in its whole organism. So with the intellectual environment and the mental qualities of man."

CORPORATION AND COOPERATION.

Corporation is the method of modern business organization. By this means, several people put their money together so as to gain the advantage that comes from a larger amount of capital. The building equipment and running of a railroad, for instance, requires more money than one man has, so many people put in their money—in some cases thousands. The building and equipping of a factory usually requires more money than the one starting it possesses. By others putting in their money the factory is made possible. In one sense the corporation is a cooperative affair. It is many people working together with their money for the good of each other.

The corporation does not lend itself so well to the organization of farm business, but the underlying principle of the corporation, that is cooperation, is admirably adapted to farm affairs. In this case it will not be only money that is put into the cooperative affair, but it will be the producing of farm products, marketing farm products, social life, credit, good will, education.

In the producting of farm products, there are two ways of cooperating-- cooperation in the growing of some one crop, as potatoes, producing of the one variety working towards a high standard of quality so as to make the locality known for that one particular kind and quality of potato. In stock raising, grow one kind of stock and that of a high quality so as to make the locality known for this.

The other way of cooperating in growing the crop is the cooperative ownership of machinery that is expensive and not much used, as silage cutters, potato planters and diggers. Threshers sires, etc.

Where there is cooperation in production it will not be difficult to bring about cooperation in marketing such products as potatoes and butter and in buying such things as machinery, binder twine and coal.

Cooperation in education is being worked out through the consolidated school. This is being furthur developed through farmers' clubs, where farmers exchange their experiences and observations. The social life and religion need to be closely united. The church should be the leader in the social life. The denomination should come together and agree on one church and make that a strong one instead of having several weak ones.

Farmers could well cooperate in the establishing of credit associations or at least in borrowing money. If farmers had an organization and this would stand back of loans there is no reason why money could not be secured for 5 per cent and 6 per cent where 10 per cent and even more is now the rule.

Cooperation will do for the farmer what corporation has done for business. The marvelous development of modern industry and business could never have done except as a result of the corporation which enabled people to work together, or if yet please, to cooperate--likewise a rapid development will come in farming when proper use is made of cooperation. Each one working by himself will not get far, neither in business nor in farming.

The whole question of cooperation among farmers is attracting more and more attention.

The Prince Edward Island Farmer says that the island province lost ten thousand in population between 1901 and 1911, without counting the natural increase which should have taken place. The soil of the island is rich, its climate good, and general conditions favorable for agriculture, but apparently farming is not sufficiently profitable to prevent the movement to the cities and to the west. The trouble, as the Island Farmer sees it, is that "on the margin between what the farmer receives and what the consumer pays an army of middlemen are not only fed but fattened." Hence it says:

There is one feature of the situation which should set our farmers thinking. They are the only class of producers in the world today who are unorganized. The manufacturers, whom the farmers outnumber almost infinitely, are so organized that they can dictate terms to governments, to transportation companies, and can even set the prices of farm products. The farmers numerically in a position to rule the world, cannot secure a reasonable concession on a government railway or company steamship. Organized, as the manufacturers are, they could command kings, governments and even railway companies. Is such organization possible? What would it mean to the world? What if the farmers had the power to set prices on the products of their farms, as the manufacturers do on the products of their factories? And the power is theirs if they only use it. As things are now, farming by the masses does not pay. It is because it does not that the farmers are leaving their farms and taking to the middle ground in the cities.

Cooperation has been tried with success by the fruit growers and shippers of the Annapolis valley, and representatives of different coopera-

tive bodies met at Berwick this week to discuss the organization of a central association with which all of them would affiliate. Such action was decided on but deferred in order to meet certain legal requirements.

Seventy farmers of Kings County will make a test of the values of organization, under conditions which would seem very favorable. They are incorporated as the Farmers' Dairy and Produce Company Limited, with a capital of $9,000 to establish and carry on a general wholesale, retail and manufacturing business in milk, dairy products, farm products, and farm supplies in all its branches. They hope to steady the price of produce, and also to reduce the average yearly cost to the consumer. If they succeed, their example will not only be followed by other farmers, but the consumers will be in full sympathy with the movement.

Use and Care of the Mowing Machine.

Editor The Maritime Farmer:—

I consider the mowing machine as the most useful labor saving implement on the farm. How often we see it kept in such a condition that it cannot do its best!

The one great point in the use of this machine is the keeping of it in proper working order. It is said that any one who can drive a horse can use a mowing machine, but I am sorry to say that there are many operators who do not keep their machine cutting as it should. The most important part of a mowing machine is the cutting bar. Keep the knives sharp, not only by grinding often but carry a file in the tool box and when you stop to rest your team for a few minutes give the knife a little touch up with the file. If there are no stones on the field a rub with a three cornered whetstone—which may be bought at almost any hardware store—will answer the purpose. These whetstones cost only a few cents each and their frequent application to the knives will be agreat saving to the team in the extra energy they have to use when the knives are dull. After mowing for an hour or so just whet up the knives for a few minutes and see how much nicer the knives will cut. The driver should be able to tell from the sound and feel how his machine is working.

The guard plates should be kept in good order. They cannot be much improved by filing. If they get worn thin and rounding on the edges they should be replaced with new ones. If the machine is properly cared for, it will last a long time; but if it is left out in the fields during nights and for days during rainy weather it will wear out much quicker. When the plates get wet they rust and the next time the machine is used the rust will wear off and they soon become rounded on the edges. Always put your machine under cover when you are not using it, if you want to get the most out of it.

Keep the guards true and level. Look them over occasionally and level them up as they frequently get knocked out of place when they strike a rock. Another point that is often sadly neglected is not keeping the machine properly oiled. When you start out give every running part a good oiling. On warm days, when the grass is dry the cutting bar and the fast running parts should be oiled at the end of every fifteen or twenty minutes. It is not necessary to use a great quantity of oil, a few drops used often is better than a lot put on at long intervals. In grinding the knives try and keep the levels as long as when the sections were new and when they get worn to a sharp point or get gapped by stones replace them with new sections. Sections cost so little now-a-days that there is no excuse for using them when out of shape. See that no belts work loose. Keep the nuts tight. The operator should be able to tell by the sound as soon as a part works loose or gets out of order. If you keep your machine in good order it will reward you by doing good work. Any one of the mowing machines that is on the market will do good work if kept in proper order. A great deal of the dissatisfaction with machines is due to the carelessness of the operator and not the machine.

Just think of your team working in the heat, perhaps tormented with flies, having to put up with using a lot of their energy in hauling a machine that could be made to run smoothly and easily if you exercised a little precaution in keeping it in good working order.

I once went to a field where a man was mowing with one horse and although his machine was only on its second season's work it was cutting badly and working very stiffly. I told the operator that his knives were dull but he said they were not as he had ground them before he had started in the morning. I asked him to get me a file and I went over the knives in about five minutes, oiled it up and asked him to drive on, when he found the machine did much better work and was easier on the horse.

Would a man think of mowing for two or three hours and not whet and sharpen his scythe. The same man, however, will often expect his horse and machine to work under very unfavorable circumstances.

Ihave had over thirty years experience with mowing machines and know that you cannot do a good job of mowing and do justice to your team unless you keep your machine in good working order.—S. G. Eccles, N. B.

What Good Roads Mean to Canada.

...The Carthaginians were the first people to make a systematic practice of road-building, but no nation derived so many various benefits as that of Rome. Great and wonderful are the monuments that perpetuate the name of Rome and everything connected with it, but none are so famous as herroads. Rome's military, commercial and imperial success was due, primarily, to her splendid system of highways, the relics of which extend from the Pillars of Hercules to the Temple of Jerusalem. But the Roman roadmakers have a far more important lesson for Canada. The world will, for all time, remember the message of Christ, which was delivered to humanity through the medium of Roman roads. There are thousands of people existing in hamlets throughout Canada, who are awaiting religious instruction. They will not emerge from their semi-barbarous state until the "Good Roads Movement" has won its way into every nook of this new country.

The attendance to the rural meeting place is diminishing; the attendance to the school-house is dwindling; friendship is being severed with the neighbor living a short distance away; and with the person to whom you regularly send a letter; and the village preacher is being discouraged. What is the reason for this? Impassable roads and nothing else. Country communities are not going to wade through mud to post a letter, to go to school, to go to church, or to visit a friend, neither will they suffer their horses to attempt it. They will not be pestered with doctor's bills because the road is transformed into a quagmire. Rural inhabitants are being degraded educationally, socially and morally. Country folk are not migrating to cities because they don't like rural life, but because the roads, if they may be called so, are impassable. These people are intelligent enough to see that all the discomfort and prevention of social enjoyment is due to the lack of good roads. Here lies the greatest lesson of the Roman road-builders. You cannot estimate in dollars and cents the national loss entailed by the constant withdrawal of labour from farms, and by the fading of the influence of the character-building institutions of the country.

Bushnell, a great American thinker says: "If new ideas are abroad, new hopes arising, you will see it by the roads that are building." Simultaneously with the movement for the need of good roads arises one far-reaching idea, even more profound than the enhansing of land values. It is the social betterment by which Canada is playing a distinguished part in the uplift of the world.

Now we turn to the meaning of roads in the economic sphere. Is it a good business policy? Canada's manufacturers, men of commerce and business admit that Canada needs such a policy, but because they cannot see any solid, unrestricted and available gain that would accrue, they don't care. The cost of a breakfast roll would be trifling did it not cost the farmer eighteen cents a bushel more to transport wheat nine miles to a railway station than it did from New York to Liverpool, a distance of three thousand one hundred miles. The cost of a boiled egg is the payment of transportation from the hen to the household. The intrinsic value of the egg is a mere trifle compared with the expense of carriage through two feet of mud.

Over the deep-rutted roads, as they exist at present, a farmer can haul, on an average, six hundred pounds in five hours with two horses. If good roads were constructed, however, it has been calculated that one horse could draw twelve hundred pounds and more in two hours. Not only would the farmer save time, conserve his energies, make better use of his vehicles and horses and thereby save money; but the consumer, too, would receive his needs at lower prices. And as Canada's agricultural production is annually increasing by leaps and bounds, a greater proportion of money would be saved by all classes of people year by year; and, probably, the high cost of living in the urban districts would recede to the normal.

"It cost the average Canadian farmer two dollars a ton to haul his produce to the market town, to the railway station or lake port. It is known that the production of field crops alone amounts to about 40,000,000 tons a year. It would be moderate to estimate that 25,000,000 of this tonnage is hauled over roads, one way or another; so we have $50,000,000 as cost of teaming field crops by the farmers. This cost could be reduced if we had first-class roads, to $20,000,000, a saving of 6 per cent., leaving $30,000,000 as a saving on one class of product alone."

The building of good roads would increase the value of taxable lands not only in the vicinity but also in the most remote parts. Stupendous amounts could be collected in taxes and the assets of the nation as well as the landlord would increase. New towns would spring up; new railway branches would be built; and Canada would be settled and developed at a miraculous rate.

Our convicts could be profitably employed building roads. Of course, it is useless to have them constructed unless carried on in a systematic and scientific way. The roads must be "graded, topped and rolled." They should be constructed so that water will quickly drain off and so that the greatest applied pressure will not force upon the foundation and cause mud to ooze up and ruts to be renewed.

Well-constructed roads shorten distances by reducing time to travel. They would give rise to a further exploration of sparsely settled districts and would result in the discovery and adoption of more mineral and timber wealth.

I feel confident that smooth hard roads would mean more to Canada than any other project. I believe that a remarkable awakening, a renaissance would take place. The economic and national advantages that would ensue are incalculable. The energetic settlement and development of Canada would swell the treasury and the country would enjoy an era of prosperity unequalled in its history. Good roads in Canada would mean a higher standard of citizenship; a people pervaded by education and good morals; and a better understanding and a mutual sympathy between the divers peoples in the Dominion.—S. Cieman, 262 Major Street, Toronto, Ont.

2000 N. S. Farmers Enjoy Outing.

The flower of the population of the Annapolis Valley, contingent to the Dominion Atlantic Railway, came to Truro on June 21st. more than two thousand strong, to enjoy a picnic at the Provincial Government Experimental Farm, and to visit the College of Agriculture. They packed two trains of nine coaches each, and there were no spare seats. The trains arrived at one o'clock, and for one and a half hours opportunity was given to the excursionists to take lunch or spread a repast where opportunity offered. Tea and coffee were dispensed at ten cents a pitcher full, but butter and sweet milk, at five cents per pint, were in heavy demand throughout the afternoon.

One exhibit of the live stock was given on the lawn in front of the College building, at the beginning of the formal programme. Then there was Prof. Smith in his laboratory, where he was kept busy identifying insects and pests. Mr. E. E. Saunders, of the Dominion Entomological Department, had specimens of the "San Jose Scale," which has proved such an awful destructive pest in the United States. A. McNeil, chief of the Fruit Division, Ottawa, was on the grounds all day, and made an instructive address from the platform.

Principal Cumming, Mr. Stevens, the newly appointed farm Superintendent, Mr. Landry and Supt. Fuller of the Agricultural Society branch of the Provincial Government service, and B. H. Landels also made addresses. The latter had in operation the Nova Scotia Government's ditching machine and gave a very effective version of the work this machine can do.

Demonstrations were made in the Dairy Department, both in butter making and soft cheese making. This proved exceedingly interesting. There were brief addresses by various visitors, and on the whole a most instructive, as well as enjoyable five hours was spent in Truro and the College property on the whole.

The old proverb in agriculture was that lime makes the father rich, but the sons poor. That might be paraphrased to say the lack of lime makes the father poor and his sons poorer. The intelligent use of lime does not make any one poor; it is the abuse of lime that might make the sons poor.

This is the time to note the effects of good preparation of the soil. Compare fields that were prepared properly last fall with fields that had to be prepared hurridly this spring. This will convince you, if you are not already convinced, that it pays to break the land early and do the work well.

An interesting fact about seeding on new soil is the length of time profitable crops may be grown without barnyard manure or fertilizers of any kind, and with no rotation of crops.

HORTICULTURE.

The San Jose Scale.

The San Jose Scale has been found recently coming into Nova Scotia alive on Ontario Nursery stock. Although all infested trees are being destroyed, the situation warrants a review of the scale proposition in other countries, and its probable effect on the orchards of Nova Scotia, should it become established.

San Jose Scale is rated by all authorities as the most serious orchard pest in America, introduced into California from Japan about 1880 and from there carried on nursery stock to New England nurseries in 1887, it has spread into almost every state and territory of the American Union and into Southern Ontario in Canada. When first introduced into these countries the damage was immense, as modern methods of fighting the pest had not then been introduced. Fumigation was not understood and Lime and Sulphur was not known as an insecticide. Crude oil and resin washes, and whale oil soap were the remedies and in many cases they did as much harm as good. Owing to its being so inconspicuous and little known it often did immense damage before the owner suspected what the trouble was. The writer, on one occasion, in Southern Illinois, saw 160 acres of peach orchard, all dead to the trunk, and was then the first one to tell the owner that San Jose Scale was affecting his trees.

The San Jose Scale, in addition to being the most destructive of orchard insects, is the most inconspicuous. When very badly infested or encrusted, as it is termed, the bark presents the appearance of being dusted with ashes when wet. When scraped with the thumb nail small yellow specks appear, the bodies of insects which are concealed under the outer scale and when numerous enough are termed "greasy." The lighter infections are hard for an untrained eye to detect. The most typical form is the half grown winter form, which is less than one third millimeter across, dark ashy colored and often concealed in crevices and in the edges of wounds. A strong magnifying glass is required to identify the scale which appears as a miniature volcano with a small nipple in the centre of the crater. As soon as the sap begins to flow in the tree, the scale starts growing and in less than a month is full grown, in the case of the female 1½ millimeters across, in that of the male, a very small two winged fly. Fertilization now takes place and a month later the females begin producing living young and continue to do so for about six weeks, at the end of which time the old female dies. The first born of the young scales are now producing the first of a second brood, breeding continues until killing frosts in the fall. Half grown scales entering the winter will live over, those younger or older, for the most part die. The immense powers of reproduction in the San Jose Scale differentiate it from our native scales, which are all single brooded. In the latitude of Washington D. C. where the scale is four or five brooded, Sanderson gives the possible increase from one female scale, in one season, as 3,216,080,400. The actual increase of course is much less.

Usually the San Jose Scale is spread, in the first instance, by importing trees into a district from an infested nursery. Once established, the wind and birds are usually the agents. The young insect moves freely over the bark of the tree from twelve to thirty-six hours after it is born and then settles down and inserts its beak into the bark, and in the case of the female remains stationary for the remainder of its existence. To move it means to kill it by breaking the beak or sucking tube. These young free moving insects will blow in a high wind from 30 to 50 feet and establish themselves on a new tree. The spread by the wind is therefore very slow. In the case of the birds, the young free moving insects often get stuck in the mud on the birds feet and are often carried half a mile by this means.

San Jose Scale will attack most plants belonging to the order Rotrceae, the Peach, Japanese Quince, Mountain Ash, Apple, European Pear, Plum, Rose, Currant and Lilac being susceptible in the order named. Of our native wild trees, the Thorne will become moderately, and the Elm and Acacia slightly infested. Coniferous trees, Maple, Birch, Beech, Ash and Alder are not susceptible. The age of the tree, in many cases influences its susceptibility. In Illinois apple trees are often found, in badly infested regions, very slightly infested. In New York State an old tree is looked upon as being just as susceptible as a young one. As our climate and conditions favors New York rather than Illinois we would look for our old trees to be quite susceptible. In the apple and peach the smooth bark is attacked only, when the bark is sloughing on the trunk no scale will be found.

At the present time living scale has been found on about 200 trees of 1911 planting. These infested trees are widely scattered, the most found in one orchard being 38, more often, however, there are only two or three. The living scale has so far been found on the stock of two Ontario nurseries only. Twelve Provincial Inspectors are now busy examining all the trees of 1911 planting and where living scale is found the infested trees are destroyed and the orchard will be kept under observation until the danger of the scale development on adjacent trees is past. In regard to 1912 importations from Ontario, nothing definite can be said at present. About 20 per cent. of the whole lot bears dead San Jose Scale. It may be August before an inspection of them can be made.

While the chances of complete extermination are small yet considering all things the attempt is well worth while, as most, if not all of the valley will be cleaned. In the present state of affairs all selections inspected are more or less infested and if the trees were allowed to remain every orchard in the valley would be infested in five years. If the inspectors can succeed in even cleaning up 90 per cent. of the sections, it will mean that probably 15 to 25 years will elapse before the whole valley would become infested. Every effort is being made by the inspectors for eradication, and if they succeed their feat will stand unparalelled.

As regards the probable damage should it become established in Nova Scotia. We are near the northern limit of the scale, and there would be little more than two broods. Our winters are mild and might in a measure offset this advantage by allowing more to live in the winter. One advantage which we have which no other infested area had when first infested is the fruit growers of the Valley not only are fitted up and well used to spraying, but they are used to spraying with Lime and Sulphur, which when used one gallon of concentrated to nine gallons of water and applied to every part of the tree in the latter part of March or in April, is above all other sprays the best for controlling the scale and more than that, it is one of the best fungicides known and will pay for its application in reduction of fungus diseases in the orchard. Miscible oil sprays are used extensively, but they have not the fungus destroying properties of Lime and Sulphur.

The up-to- date orchardist of the Annapolis Valley will receive no setback if the San Jose Scale should by annual winter spraying will pay for itself in cleaner and more fruit, and the scaby, wormy fruit which comes from unsprayed orchards and which now compete with his own on the market will to a great extent be removed by the destruction of unsprayed trees by the scale. In this regard I may cite the case of the Niagara district in Ontario, before the San Jose Scale appeared there there was usually either a bumper crop when prices would be down followed by a very short crop when prices would soar, but total returns small. Since the scale appeared there, and annual winter spraying with Lime and Sulphur become a necessity, they have not had a failure nor a bumper crop, but a succession of even crops which feed the market almost all it will take and still keep the price as high as a short crop. Many of the Niagara growers contend that the San Jose Scale has been a blessing in disguise, and we can see no reason why what is true for Niagaras should not be true for the Annapolis Valley.

The net returns from an orchard infested with San Jose Scale and under proper management, are usually as large, and in many cases larger, than from similar properties not infested, and where winter spraying is not practised. Therefore the Annapolis Valley Fruit Growers should not look upon scale as a pest which will depreciate the value of his property, but as an insect which will force him to adopt a newspray, which will control the scale absolutely, although it will not exterminate it, and will pay for itself as a fungicide in cleaner and better fruit.—G. E. Sanders, N. S. Field Officer, Division of Entomology.

Spraying Letter.

Owing to the Black Spot making its appearance upon the apple crop this last few days, we consider it is our duty to throw out a warning to the fruit growers who have been using our spray.

If good results are not obtained, even through carelessness on the part of the user, Lime-Sulphur will get the blame. Hence our reason coupled with our interest in fruit growing for writing this article.

Upon close observation from different parts of the fruit growing Counties of Nova Scotia, we feel safe in predicting that a large percentage of this years apple crop will be worse than valueless, that is if the ravages of the Spot continues as it has during the past week.

In some sections of the country we find orchards where the fruit growers think they have been spraying, with very little visible spray upon the leaves. These are the orchards where as one man said only yesterday, "Why half of my Gravensteins are already spotted."

Again, we could name a few orchards where about every leaf upon the tree bears evidence of thorough spraying. We hope later on with the owners permission to publish the names of these fruit growers, for without doubt those orchards will be a monument to show up surrounding carelessness or indifference. Right here we want to say to the man who is making a 40 gals. bbl. of spray go over a dozen large apple trees in full foliage, they must not blame Lime-Sulphur if they do not get good results.

Prof. Caesar of Guelph College, Ontario, says it takes from six to ten gals. to thoroughly spray a large tree at one spraying. How many orchardists in the Valley have applied one half of it? Yet the same Fruit Growers say, "Why I sprayed thoroughly," and in the end will only encourage some "doubting Thomas."

Our advice to those who have already made two or three sprayings is to continue, and those who have not if there are any such, to immediately get busy and cover the surface of their apples and leaves to prevent the clean ones from Spot and its spread over the ones already infested. According to the fruit crop reports recently at hand, apples will be worth something this year and every barrel of otherwise No. 1 apples packed as No. 3 will cost the owner from $2.00 to $3.00 per bbl.

In conclusion we wish to say that spotted apples this year will have to go either into the No. 3 bbl. or the cider mill. The good work the Co-Operative Companies are doing will not allow trash to ruin the reputation of honest packing.

Fruit growing is getting to be a science and those who do not believe in efficient and thorough spraying had better court some other livelihood.—Niagara Spray Co. of Nova Scotia, Limited, Kentville, June 25 1912.

Keep the Orchard Healthy.

So feed the orchard as to maintain a healthy tree growth and to supply needs for a bountiful yield of fruit. The quantity of plant food to be added will depend, of course, on the fertility of the soil. It is an excellent plan when the trees are in bearing, to apply broadcast each season, preferably during July or August, from ten to fifteen big loads of good stable manure per acre, if you can get it, or its equivalent in commercial fertilizers. Applied at the time suggested, it matters little whether the fertilizer is left on the surface or cultivated into the soil. Water from subsequent rains sinking into the soil will carry the plant food down to the tree roots.

Circumventing the Squash Bug.

Last season I tried the old way of trapping the squash bug, and it was an emphatic success. I laid down a shingle beside each hill and early in the morning turned them over and killed the bugs.

At the start I would find from three to 18 clinging to the underside of each shingle. The numbers grew less and less, till finally they seemed all gone, and the vines were the rankest and thrieftiest I ever had. On account of the depredations of the bugs it is almost impossible to raise Hubbard squashes in this vicinity. If 10 days vigilance at the start will head them off, it is time well spent. —E. P. Snyder, Huron Co. O.

Mr. R. J. Messenger, Ex-president of the N. S. F. G. A. was in town yesterday, soliciting special prizes for the Nova Scotia Horticultural Exhibition to be held in Bridgetown, next September. Mr. Messenger says the apple crop in Lawrencetown will not be a heavy one, besides that he fears a spotted crop if the fruit growers do not spray continuously, owing to the wet season. Although he has, himself sprayed four times he finds the black spot appearing upon the leaves of his fruit trees. His advice is to spray faithfully if clean apples are expected.—Kentville Orchardist.

Moisture is very essential to the development of vegetables at this season of the year. Where the garden soil is not quite as rich as it should be for vegetables it requires an enormous amount of moisture when the weather is warm and the dry evaporating winds sweep over the country. Those who can sprinkle are fortunate as under such conditions good vegetables can be produced during late summer when they are most needed.

The destruction of weeds is not nearly so important, usually, as late in the season as keeping a dust mulch on the soil. Save the soil moisture by cultivation.

PANDORA RANGE

Seeing this splendid range places you under no obligation to buy. We guarantee the "Pandora" just as willingly as McClary people because we know its perfections just as thoroughly.

Orchard Spraying Experiments.

The Maine Agricultural Experiment Station has issued under the above title Bulletin No. 198, which is a second of a series giving the results of spraying with fungicides and insecticides of the apple. The work of 1911 is preceded by a condensed account of similar experiments of the season of 1910. The 1911 experiments are discussed under two heads: Those carried on at Highmoor Farm; and cooperative experiments in the orchards of three practical fruit growers in the town of Greene. The results in both places were practically alike.

It was shown that the season was very unfavorable for the development of the enemies of the apple and that in the absence of pests the comparative results regarding their control are not so striking as in the preceding year when both insects and fungi were abundant.

The calyx injury which was noted in 1910 on trees sprayed with lime-sulphur and lead arsenate is now considered to have had a more direct relation to the vigor of the trees than to the chemical action of the spray. The superiority of lime-sulphur over bordeaux mixture as a fungicide for susceptible varities such as Ben Davis has again been demonstrated when conditions were most favorable for using bordeaux. A large amount of bordeaux injury occurred, whereas no spray injury was done to leaves or fruit on the lime-sulphur plots.

Sunburn or sunscald of the fruit as the result of the unusual heat wave of last July is shown to have been entirely independent of spray injury and very largely due to insufficient protection of fruit by the foliage. No injury to fruit or foliage resulted from the use of the carbonic acid gas sprayer in making the applications. The results did not indicate any definite relation of fruit russeting to the strength of the lime-sulphur used. Nothing appeared in the experiment which pointed to the chemical composition of the lime-sulphur-lead arsenate combination as a factor related to russeting of fruit.

An appendix gives the latest formula for making the stock lime-sulphur concentrate, with the dilution table and directions for using the latter.

The Cost of Apples.

After a review of several hundred replies from apple growers in the state of Washington, the state agricultural college concluded that the cost of growing and placing a box of apples (one bushel) upon the market, using only the best method and highest standard of pack, is 53·1 cents. Eighty-four per cent. of these growers started orchards with one year old trees, planted 70 to an acre, at a distance varied from 16 to 33 feet. The cost of setting out the trees ranges from 10 to 12 cents for each tree planted. The cost of planting and caring for an acre of apple orchard for the first six years amounts to $69·35 under the conditions estimated for the Palouse district; $90 an acre is the average capital for bearing orchards.—The Evaporator.

Wait and You Lose

Under this unusual offer such full smoothness of tea flavor is far too good to miss even for a few days. Buy to-day from your dealer with this guarantee:

In case you do not like the flavor, indeed, if you are not delighted with it, please return the broken package and have your money refunded.

Nothing but exceptional Tea could bear that test. The 40c. grade will be found particularly pleasing.

35, 40, 50c. per. lb.

RU-BER-OID Roofing

TRADE MARK REGISTERED.

Gives Most Protection Per Dollar of Cost

RU-BER-OID'S cost per roll is moderate. The cost of laying is very small, as skilled labor is not required. The only upkeep cost is a coat of RUBERINE Cement every three or four years.

RU-BER-OID is weather-proof, not affected by acids, fumes, gases or extremes of heat or cold, and strongly fire-resisting.

This complete protection has lasted, in the case of the first RU-BER-OID Roofs laid in 1891, for 21 years—and these roofs look good for many more years of service.

Our Booklet, "RU-BER-OID—Why?" explains why RU-BER-OID costs least per year of service. If you are interested in roofing, write for it, and for samples of RU-BER-OID, made under Canadian Patents 93,027 and 93,160, in Colors—Red, Brown, Green—and in natural Slate.

THE STANDARD PAINT CO. OF CANADA, LIMITED.
MONTREAL. WINNIPEG. VANCOUVER. 89

"Have you heard of the wonderful One Hoss Chay
That was built in such a logical way
It ran a hundred years to a day ..... ?"

Well, the ENTERPRISE MOMARCH STEEL RANGE is built like that. There's no "weakest spot" in the Monarch. The body of the range is made of "Steel of the finest, bright and blue," and every part throughout is perfect in fit and finish.

Being ornamental, easy to keep clean, simple to operate, accurate and economical, this range will endear itself to the housekeeper as the "one horse chay" did to the family of the Deacon. Like the chaise too, the "Monarch" is a "Wonder and nothing less."

With it's extension fire box for wood burning, and good supply of hot water, the Monarch is particularly adapted to farm kitchens.

Ask the nearest Enterprise dealer to show you this range, or write us direct for circular and particulars.

DAIRYING.

Cheese Prospects.

Having in view the export from Canada in the near future of the 1912 new cheese, your Commissioner has interviewed the trade of Lancashire on the prospects for next season, and for general information and suggestions.

The first week of May found cheese stocks very low—the lowest for many years—and the past and present week has helped to clear all stocks of old Canadian cheese, and in consequence of labour troubles in London, the market just now is very strong; New Zealand averaging 76s. to 78s. per cwt., and some choice cheese have touched 80s.

The importers interviewed here suggest, that they cannot take much interest in the Canadian new season's cheese unless prices come down a great deal, and point to reported extra large shipments from New Zealand as well as the fact that Cheshire cheese is coming forward very freely. However, when consideration is given to the fact that the general trade of this district is excellent, with better wages being paid to all sections of workers—who are the cheese consumers—there is no doubt that the coming season should be a 'bumper' one, and that Canadian cheese should command a better price than last year, especially if the quality will average up to the past season's standard; all dealers stating that the quality of Canadian cheese was never better than that of last year.

The size and weight of cheese is debated to a considerable extent, some claiming that there are many breakages due to the increasing size of Canadian cheese, which results in rough handling. However, there is a very divided opinion in regard to this question, as the larger retail dealers who cut up a large quantity of cheese, desire big sizes, as they make a better display on counter and in the window; while the retailer who handles a less quantity in a given time, prefers the smaller cheese, as it will not go dry before he cuts the whole of it up. It would seem, taking all points of view into consideration, that Canadian cheese would be more acceptable if they did not run over 80 lbs.

Another complaint made was, that from some districts the boxes seem to be made from as poor a quality of wood as it is possible to obtain, and in connection with this, there is no doubt that some very poor attempts at cooperage are shown in a large percentage of the cheese shipped over here.

The chief grievance as laid down by all cheese importers, is that Canadian cheese invariably arrives here weighing less than the amount stencilled on the box, which of course results in a loss to the trader on this side. It is a very rare exception that cheese arrives here full weight, and these exceptions are from Ingersoll, Belleville and Brockville districts alone.—W. J. Egan, Trade Commissioner, Manchester, England.

Healthy Cows.

It is of more vital importance that cattle of this land be healthy than any other stock. Milk is consumed raw, butter is raw, and a great per cent of the beef is consumed in practically a few (we say "rare" at the hotels) states. It behooves us then to be more concerned in the health of our cows in particular because they are more subject to disease and spread it more rapidly than the beef cattle.

As a rule the dairy cows are too closely housed. This would not be detrimental to health if proper attention were given to sanitary conditions in the barns. But we know that barns with proper ventilation and clean mangers and floors are few in number.

The cause of such a state of affairs is natural. For years farmers have known that the cow was a sure source of profit. So when a young couple get married and start to farm they naturally look to the cow as a sure income to help in time of greatest need. A little cow shed is built and soon it is overcrowded with the offspring of the cow. They build a larger shed, for they are not yet out of debt, and use the old shed for the calves. It may be years before a good barn can be built. In the meantime the poorly ventilated sheds have been overstocked and have received little sanitary care. The young farmer was too busy getting a start to fuss with such matters as cow comforts and sanitation.

Disease gets a foothold in the stuffy shed. The herd increases and so does tuberculosis. Losses occur in the herd, and now and then a hog wastes away. Little is thought of it and when the new barn is finally built it is at once polluted with disease from that same herd. Fortunate is the man whose family has not likewise been rent in twain by the great white plague.

How can we remedy this condition of affairs? Men must start poor and build cow sheds, and they must at times overcrowd these sheds.

The remedy is to put in a ventilating system in every shed or building where stock is housed. Fresh air and sunshine are death to disease germs. Stock can be crowded pretty close for a time when necessary if they are not denied fresh air and sunshine.

Do not wait for the law to compel you to dispose of your diseased stock. You can't afford to carry the risk. It is to your best financial interests to prevent disease. It is cheaper to build a fresh air shaft than to lose just one cow. It is cheaper to keep barns clean than to pay the tax of death.

Let in pure air—lots of it. Use white-wash—lots of it. Keep things clean externally, internally and eternally.—Western Farmer.

Choosing a Sire.

In selecting the sire for the herd, a great many breeders, particularly among the amateur breeders, make only one demand—that the sire be be purebred and registered. One should go farther than this and demand that the ancestors of the animal in question be animals of merit, large producers and be typical for the breed. A great many of the purebred bulls in use today as herd headers are no better than scrubs. For the best results we should demand that the female ancestors be large producers of milk and butter instead of being satisfied with knowing that the sire or dam or some other animal in the pedigree carried off the show ring prize at a certain fair. The dairyman is primarily interested in how much milk and butterfat he can obtain from his herd. This is the basis of income and profit. Very few milk producers or dairymen will ever lead their herd bull into the show ring. Then why should so much attention be paid to the show ring ancestry of the bull or of the bull himself?

The immediate ancestors of the herd bull are ones that should concern us most. It is more important that his dam and granddams be high producers than for him to be related to some great and wonderful cow that appears in his pedigree five or six generations back. Too much attention is paid to individual animals or families that may be represented or appear in the pedigree.

In selecting the herd bull there are two courses open to the breeder. The one is to select a young bull, and the other is to select an old bull that has been tried and proved to be a prepotent animal. The advantage in selecting a young bull for the herd is that it is cheaper and less risk is attended toward getting a mean and ugly bull as well as bringing any disease into the herd. In selecting a young bull one runs greater risk in getting one that will transmit the characteristics desired than in selecting an old bull that has been tried. The performance and records in the ancestry are about the only guide that can be used in this selection. When one selects an old bull that has been tried he has some certainty that this animal will raise the production of his herd. When this can be done it is probably the best method to use, but where one knows the value of a bull the price asked for him is oftentimes prohibitive.—Selected.

Age to Sell Cows.

What is the use of raising cattle that do not pay? Cattle were designed for two special purposes, milk and beef, and the present day farmer is getting some pretty good lessons on the utility features of the cow. It is found that some cows of practically all breeds pay from a milk standpoint of production, while a great many of all breeds do not pay. Can the farmer or cow owner afford to keep the kind of cow that does not give milk enough to put her on the paying side of the account? Some cows of the beef breed give all the milk and more than the calf can take when they are fresh. Is this a good quality in this cow or is it not?

On the other hand, there are a great many cows whose milk supply is not sufficient to raise a good, well fed calf. It is believed by many close observers that the nearer approach to masculinity in the cow the farther she recedes from the motherly qualities and fitness to fulfil the natural relationships of mother and offspring, the less powerful she is in transmitting her breed characteristics that tend towards improvement in the animal. The big milkers, the liberal milkers, in all breeds find favor with their owners and this quality in the cow has never been a cause of turning a prospective buyer away, while the lack of it is a never ending source of objection. Who ever heard of a cow that raised her calf too well? If there are such objectionable cows they are provided with two calves and the objection is cured.

The time is close at hand when the big milker, it matters not what breed she represents, is the cow that will be in demand. Not particularly because she is required to fulfil any dairy test or milk producing obligation that demands a butter fat record, but because she is expected to produce and raise from her own personal resources a big, fat, healthy calf, unaided.

The difference between a cow that will produce 450 pounds of butter in a year and one that produces 150 pounds is the proposition that the practical dairymen are finding out today. This is the test of value in the dairy cow, to determine whether she is paying expenses or not. There was a time when it did not make any difference, the farmer kept about so many cows at any rate, and there were many or few milked, just as the conditions, help, etc., seemed to favor. That time has passed and the emphasis is being more and more placed on the cost of things.

False Economy.

It seems exorbitant and unreasonable to many farmers to pay from $150 to $300 for a good bull and yet they do not seem to have the same sense of unreasonableness when they make other purchases. They will not hesitate to buy a good horse paying from $200 to $300, and yet such a horse can never be made to yield the profit on the investment that a good bull will. Moreover the work a horse does lasts, as a rule, but one season, while that of the bull is carried on for years to come.

There is a lack of sense of economic values in this attitude of mind that amounts to a serious drawback in the fortunes of many farmers. Not long since we were talking with a well-to-do farmer in a neighboring township. He was telling us of some of the short-sighted moves he had made, and said:

"Fifteen years ago I was offered 10 registered Holstein heifers and a first-class pure-bred bull for $2,000; I thought it was too much money to pay. I looked only at the money and not at what it would bring me; I ought to have borrowed the money, even at high interest, and bought the cattle, for if I had I would have made several thousand dollars by it."

A wise old farmer once said to us that he had never seen a farmer grow poorer by trying to improve his soil, or his cattle, or his buildings. And still in the face of this big truth how many farmers do we see who for years have hesitated about doing either of these good things because they thought it would "cost too much."

It pays to search for a few principles like the foregoing and stay by them just as a sea captain will stay by the compass when he is out of sight of land. Every farmer loses more in 10 years, by having poor soil, or by having unprofitable cows, or by having unsanitary stables, than what it would cost to have them made efficient.

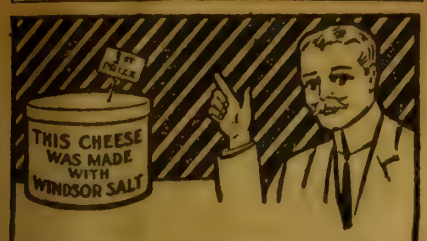
It is this hesitating, false sense of economy, that has kept thousands of farmers under the harrow all their lives.—Hoard's Dairyman.

Extra Cost of Producing Clean Milk.

G. M. Whitaker of the bureau of animal industry, has found that to increase the score of a dairy from 42 to approximately 70 points, there may be in 15-cow dairies an added expense of five cents per cow per day for labor, plus, in extreme cases, 5½ cents for a new or additional equipment; and if five cents more is added to remunerate the proprietor for his extra care and vigilance, there will be an extreme increase of 15½ cents per cow per day. The product of a cow ranges from 4,000 to 10,000 pounds of milk a year, or from 5 to 12 quarts a day. The added expense for labor would, therefore, he states, amount to about half a cent to one cent a quart, and in rare instances where great additional expense is required for repairs, new construction and new equipment this might raise the increase one to two cents a quart more. But this added expense of improved methods and equipment would no doubt be partly offset by increased production and increased eronomy of feed, so that the net extra expense of producing clean milk would probably be somewhat less than this. A reasonably clean milk is worth two cents more than common slovenly milk. The former is safer and therefore cheaper, at the increased price. Dirty milk ought not to be considered a merchantable article at any no matter how low.

Cream must be kept cool if good butter is to be made. A warm temperature means rapid development of lactic acid bacteria and often those organisms that produce undesirable flavors.

A Holstein cow died at Phillipsville, Ont., after undergoing milking tests four times a day for two weeks, in which a record was made. A cow is like a man in some respects. It can be worked overtime, but not for long without suffering. Nature exacts a penalty when it is abused.



NOTHING in cheese making is more important than salting the curd.

The flavor—even color—smoothness—keeping quality and market price—all depend on the way the curd is salted, and on the salt used.

WINDSOR CHEESE SALT

Makes Prize Cheese

It gives a smooth, rich flavor to the cheese—dissolves slowly—stays in the curd—and makes the cheese keep as good cheese should.

Windsor Cheese Salt is cheapest in the end because it goes further. 73C

Cow-Ease

Prevents Ticks.

KEEPS FLIES OFF

Cattle and Horses

and allows cows to feed in peace, making **More Milk** and **More Money** for you. A clean, harmless liquid preparation, applied with a sprayer. Keeps cows in good condition, and saves five times its cost in extra milk.

TRIAL OFFER

If your dealer cannot supply you, send us his name and $1.25, and we will deliver prepaid to your address a half-gallon can of COW-EASE and SPRAYER for applying. For West of Missouri River and for Canada, above Trial Offer, $1.50.

Satisfaction or Money Back.

The Loss of Butterfat in Whey.

In a recent issue of your valuable paper I noticed an article on "The Loss of Butterfat in the Whey," which calls to mind an incident that I witnessed a short time ago near Marion, Wis. In a cheese factory which was at the time receiving about 4,000 pounds of milk, representing the milk from about 50 cows, a whey separator was being tested out. The milk was made into American cheese and was being handled in every respect according to the established custom. The milk was normal in every way. After the whey was drawn it was run through the whey separator, which recovered from it 36 1-2 pounds of cream, testing 32 per cent. butterfat, which would make about 14 pounds of butter, representing the product of about 20 average cows. In other words, to allow this whey to go unskimmed would be equivalent to practically throwing away the butterfat produced by 20 cows.

The cream was remarkably smooth and seemed to be of excellent quality, different from normal cream only in that it seemed to be thinner. While there was a slight whey flavor noticeable, this was not pronounced enough to be called objectionable. The run I witnessed was the first one that had been made with this particular whey separator and it had not been properly adjusted. I understand the machine is designed to deliver a cream containing from 60 to 70 per cent. of butterfat, and in fact tests have been made with it in which the percentage of butterfat in the cream ran as high as 78 per cent.

This exceedingly rich whey cream contains so small an amount of whey that the addition of sufficient good, clean skim-milk starter to reduce the percentage of butterfat to 35 or 40 per cent. should make a cream that is equal to all intents and purposes to a good first-class creamery cream, and butter that is made from whey cream treated in this way will, without doubt, be equal to extra creamery butter and sell for such on the market.

The incident above referred to convinces me that the cheese factory patrons in the State of Wisconsin have lost millions of dollars on account of not skimming their whey.—Hoard's Dairyman.

Coarse or Fine Withers

The one conclusive test of the value of a dairy cow is that which comes through the scales and the fat test. But there are several points in connection with a dairy cow's conformation to which considerable importance may be attached, and which in many cases are about all that a buyer can depend upon. Suppose, for instance, that one in purchasing a heifer that has never had a calf and that will not be fresh for some four months yet, one cannot, in the very nature of things, enquire about what her milking performance has been, because she has never been in milk.

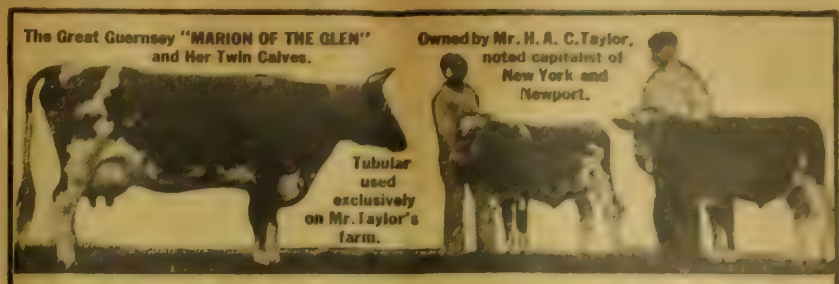
A few months ago a dairy professor at one of the largest experiment stations in the United States took the writer through the dairy barns and told him the records of a score or more of cows that had been tested for milk and butter fat production for several years.

"Is there any peculiarity of conformation, by which, more than any other, you can pick out the heavy producers?" we asked the professor.

"If I had to name the characteristic that seems the most constantly to accompany heavy milking and liberal butter production in this herd," he said, "I would name the sharp, fine wither."

Then we took a look over the herd to see how it worked out. In every case we found that the top-notch cows had very sharp withers. One cow that seemed to possess fair dairy conformation in some respects but that did not give one-half as much as many of the others was very coarse in the withers. And the rule held pretty well all through the herd.

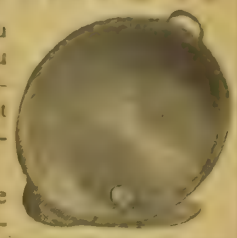
Look over your own cows and see how this rule applies to them.



The Great Guernsey "MARION OF THE GLEN" and Her Twin Calves.
Tubular used exclusively on Mr. Taylor's farm.
Owned by Mr. H. A. C. Taylor, noted capitalist of New York and Newport.

What You SEE You KNOW

That is why we show you these two pans. We want you to SEE and KNOW the difference between the World's Best Cream Separator and less modern machines.



The full pan contains the disks taken from one of the thousands of separators which have been replaced by Tubulars. They tire a woman and try her patience, they twist, wear loose, eventually give cream a metallic or disky flavor, and waste cream in the skimmed milk.

The other pan contains the only piece used inside the marvelously simple, wonderfully clean skimming, everlastingly durable

SHARPLES **Dairy Tubular Cream SEPARATOR**

What a difference! Take your choice, of course, but remember that mistakes are unpleasant and costly and must eventually be corrected. Why not ask those who have discarded other separators for Tubulars? Their advice is valuable; they have paid good money for experience—they know the difference.

Write for a full, free trial. Other separators taken in part payment for Tubulars. To get prompt attention, ask for Catalog 194

Beefmaking and Dairying.

There can be neither economic nor moral opposition on the part of dairymen to the expansion and maintenance of the beef cattle industry. For reasons equally sound, breeders and feeders of beef cattle cannot have any valid objections to the development of dairying up to the hilt of its possibilities. Productive industries that nature and the requirements of mankind have combined for interdependent usefulness are not mutually antagonistic.

Dairying has a large and exceedingly important niche to fill in the economy of modern agriculture; beefmaking likewise has its broad and special place. Neither of these industries are at war with the other; both are indispensable as cteative arts, yielding human food that classifies as an economic necessity. In most cases the peculiarities of individual temperaments preclude the breeding of both beef and dairy cattle on the same farm, or even in the same community, which because of favorable physical conditions or temperament of its farmers may have adopted one to the practical exclusion of the other. Some men are adapted to the exacting details inseparable from dairying; they like the work and delight in mastering it. Others have an innate antipathy to dairying, but look upon beef-making, from the breeding to the feeding out of the stock, as an art in which they can express their abilities and find satisfaction.

After all, in this young country men who own land can and eventually will do largely as they please. Necessity does not commonly spur or whip the land-owner. He may be gently swerved by its threats, but he is in a position to live his life; follow his fancies and respect his personal demands for this or that kind of activity, unhampered by economic thraldom. In such circumstances he can practise methods or pursue systems that he knows to be less profitable than others which he could easily employ; but he has himself to please, and that means more to him than making greater profits. While not indifferent to the financial side of his operations, there are other facors involved which to him have a deep personal significance.

It is in the realm of the temperament that one is to seek the causes of which the different systems of farming are the effects. Hundreds of farmers are destined by unalterable traits to breed or to feed beef cattle; as many others are qualified in the same way for handling the dairy cow. Enthusiastic champions of these types of production attempt the impossible when they set about to convert a neighborhood of farmers to one or the other. Imagine the W. S. Van Nattas, the W. A. Drydens, the W. A. Harrises and the B. R. Pierces personally managing a business of which the milkcan is the symbol! Fancy the H. B. Gurlers, the W. D. Hoards, the E. A. Powells and others of their unshakable faith in the dairy cow ransacking the Chicago stockyards for carloads of feeder steers!

All the precepts and examples that dairymen can summon up in an attempt to convert beefmakers to their way of thinking are futile; all appeal from advocates of the beef production to bring dairymen into their fold is unavailing. But we need enthusiasts. We shall never have enough dairymen who are absolutely sure that theirs is the best business in the world; we shall never be oversupplied with beefmakers who are convinced that in the long run theirs is the soundest system of agriculture open to cornbelt farmers. America is a land of great spaces, with ample room for all the pure-bred stock that can be raised, whether it be for beef, milk, power or wool.

What should be avoided is a narrow disinterested attitude on the part of beefmakers toward dairying and on the part of dairymen toward beefmaking. Neither side has any warrant for a feeling of competitive jealousy. Neither threatens or can supplant the other. Bring the case down to actual life, and we find dairymen enjoying steaks and chops no less than beefmakers relish prime dairy products.

Beefmaking and dairying are twins that can and should attain magnificent stature without the slightest fraternal friction.—Breeders Gazette.

Pig-Eating Sows.

F. R. writes:—"Please give me a cure for the habit that some sows have of eating their newly-born pigs. One man says that it is caused by feeding fresh meat before farrowing time; that the sow gets in a frenzy during the birth of her pigs. Another says that if sows are properly fed they will not eat their pigs. Some sows are said to eat their pigs from habit, one having eaten four litters in succession. It is discouraging for the farmer to have sows kill their young when the price of hogs is as high as at present."

Improper feeding and handling may get the sow into an unhealthy condition at farrowing time so that she is feverish, and consequently restless, uneasy and easily disturbed. Under such conditions she may kill a pig and having killed may also eat it. Again some sows have been fed an insufficient amount of protein, so that they have a great craving for this material, and since the body of a young pig is very rich in protein the little fellow may be killed and eaten to supply this nutrient. The same may also be said in regard to mineral matter. It is even possible that sows will kill and eat pigs from force of habit. Having done so once for reasons outlined, it may become a habit with them, so that it is continued. Mature sows do not need much protein in their ration at any time, but they should have a sufficiency of it and sufficient mineral matter together with water and the other necessary attentions to put them in good condition, and then with good care and treatment they ought not to kill and eat pigs.

Community Breeding.

A writer in an exchange offers many valuable suggestions for community breeding. In many parts of Ontario this practice maintains, notably in Hastings county, and round about Osgoode and Perth.

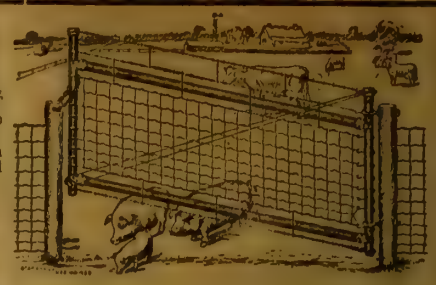
WHY?

"1—Community breeding should be established to elevate the standard of (a) interest—a breeder's interest is always increased when his neighbors and townsmen are engaged with him in the same line of work, thereby affording an opportunity for measuring progress; (b) improved methods, increased interest, and easy means of making comparison is invariably followed by improved methods; (c) uniformity of type. Frequent conferences with other men engaged in raising the same breed of stock will lead farmers gradually to think and to act along the same lines. Appreciation of what others are doing, of stock they are breeding, will lead to exchange of stock; and consequently to a more general breeding along the same lines, and these conditions will bring about greater uniformity of type.

"2—Community breeding will establish a reputation for increased interest, improved methods, and uniformity of type, will produce better stock,

Farm Gates

HAVE GATES THAT HANG TRUE, OPEN AND SHUT EASILY, LIFT OVER SNOW IN WINTER; that keep back breachy stock; that will not burn, or, blow down, sag, bend or break; that last a lifetime; that are guaranteed against all defects. In short have



Clay Steel Farm Gates

on your farm. Made of high carbon steel tubing of large diameter and heavy wire fabric. May cost more but worth more.

Clay Gates are sent for 60 days free trial that you may prove them before buying. 20,000 sold last year on these terms. Send to-day for illustrated price list

Clay Gates are made to many styles and sizes—a gate for every purpose. They can be raised to let small stock through, yet keep back horses and cattle.

I GUARANTEE every Clay Gate to be free from defects in material or workmanship. I will replace, free of cost any parts or the entire gate giving out for such reasons.

enhance values, increase numbers, establish a reputation and attract prospective purchasers.

VALUE TO THE INDIVIDUAL.

"1—Improved stock are close at hand from which to select.

"2—A great stimulus is caused by the enthusiasm of others. A man's ambition to excel is aroused and he is more likely to set out on a comprehensive plan of stock improvement.

"3—Opportunities for co-operation in the buying, selling, and exchanging of stock are enlarged.

"4—Value of stock is increased.

VALUE TO THE COMMUNITY.

"1—Reputation of a community as a distributing centre is established.

"2—Opportunities for profitable sale of live stock are multiplied and the community at once gains a valuable asset.

HOW ESTABLISHED. ...

"Several plans, separate and distinct in their organization, have been put in successful operation:

"1—The first plan we will outline includes the organization of an association, the co-operative ownership and use of pure-bred bulls, and financial assistance from the government.

"2—The second plan involves the organization of an association and incorporation of the same; its division into groups based upon the number of cows owned by the members; the purchase of one pure-bred bull for each group, and the exchange of bulls at the close of each two-year period from one group in the association to another group in the same association.

"3—In the third plan an association is formed for the purpose of promoting a particular breed of stock, and each member pledges himself to use only a pure-bred bull for the particular breed adopted by the association.

"This plan admits of the ownership of pure-bred males, either individually or co-operatively, and is the general plan thus far adopted by the associations already organized in Maine, of which there are six. Plans are now being formulated to stimulate the interest in associated work along these lines to increase the number and to organize more definitely the constructive work of our associations.

Can Prevent Foot and Mouth Disease.

Berlin, June 1.—A discovery of the first importance to the Canadian and American cattle raising industry is reported by Professor Wilhelm Grugel, dean of the Hygenic institute and the University of Rostock.

Professor Grugel announces that he has not only found the bacillus which caused foot-and-mouth disease, but has also found serum immunizing cattle against the malady. The serum is not curative, but preventive, and can, therefore be administered only to healthy animals. Experiments with a large number of cattle, it is stated, proved unqualifiedly successful.

Professor Grugel says the only feature requiring further investigation is the determination of the strength of the serum and the length of time the immunization remains effective. He is continuing his experiments along these lines.

It is stated that Professor Grugel would have been able to announce his discovery several months ago, but for the bureaucratic opposition he encountered on the part of the Prussian department of agriculture.

The serum is not yet available for general purposes, but it will soon be obtainable. Professor Grugel says it can be produced so cheaply as to enable its sale at the rate of 75 cents per animal treated.

For New Vitality Send Me The FREE COUPON

There is to-day no excuse for any man remaining weak. The vital, manly man is admired by all men as well as all women; there is an influence about him no one can resist; he knows no fear; he knows no weakness; he knows no result of debility. It is this same VITALITY which carries our young soldiers to war without thought of death. Vitality, reader, is what you MUST have if you would enjoy a life of health, strength and manly vigor. I can give you this same life and vitality; if I can do for you what I am doing for thousands of others I can put the vigor of youth into your blood and nerves; I can make you feel young again and keep you feeling young; I can drive away all dibility, weakness and despondency. You will laugh at trouble, you will tackle obstacles with the vim to win, just as all other hearty vital men may do. I don't ask you to use drugs. I ask no change in your present mode of living; just cease all dissipation and then use my HEALTH BELT. All else will come. My Health Belt with suspensory attachment is the greatest nature cure and VITALITY supply that the world has ever known or probably ever will know. Nothing is taken for granted: you feel better immediately, at once, from the first time used. Worn all night, while you sleep, it pours a great stream of Vitality and energy into your weakened system: it is a wonder-working giant of power; made as I now make it, I am getting results of which no man ever dreamed. Just think, over ten thousand men applied to me during the month of February. I am now sending great shipments of my Health Belt to every part of the civilized world. There is a reason, I am curing; I am giving men back their lost strength. It makes you feel ambitious, full of vim; you awaken mornings sparkling with bright, clear-eyed, clear-brained health; the weakness has all disappeared from your back; you are "just feeling fine." Special attachments to my Health Belt cure rheumatism, kidney, liver and stomach trouble.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigor. It is a word of hope, a carefully written interesting booklet, which should be in everyone's possession. Therefore, send to-day. If in or near the city, call at my office

THE HORSE.

Feeding Work Horses.

The problem of feeding work horses is one involving the economical production of energy and maintenance of health. It is of considerable importance to know how much hay and how much grain a farm work horse at hard labor should receive in order that he may work with the greatest efficiency and economy. With high priced grains it is very desirable to know the relative value of different roughages in order that economy may be practised in making up a ration for work horses. In order to determine some of these points a number of experiments have been conducted at the Illinois Experimental station in feeding horses used for teaming and field work.

The object of those experiments was to secure data for comparison of rations for feeding farm work horses with respect to the following points: First, maintenance of weight; second, their health, spirit and ability to work; third, economy of the ration.

In the spring of 1908 a test was planned involving seven teams, whereby one horse in each team was to receive timothy hay the other clover hay. With but a few exceptions each horse in the team worked an equal number of hours with his mate and at the same kind of labor.

After a text extending over 336 days the following conclusions were reached:

Where a mixed bran ration of oats, corn, oilmeal and bran is fed, clover hay is equally as efficient if not a little superior to timothy for horses at hard work.

There was no observable difference in the effect of clover and timothy upon the spirit of the horses or their ability to endure hot weather. Those receiving clover had a glossier coat of hair and their bowels were looser, but not too loose to endure hard work.

When clover is used as horse feed the quality should be good and the quantity fed limited.

A slight saving in grain may be made by mingling it with chaffed hay, but saving in this test did not appear to be enough to justify the expense.

There may be a benefit not shown in these tests in preserving the horse's health by mingling the grain with the chaffed hay. The results of this test are not conclusive on this point.

Where the grain was ground and mingled with chaffed clover and with chaffed alfalfa, the latter proved to be a little more efficient in preventing loss in weight than where timothy hay was fed. In this test there was a saving of about 22 per cent, of grain.

Though too short to be conclusive, these facts indicate that mature horses at hard work can be maintained quite satisfactorily, for a short time at least, on corn fed in conjunction with alfalfa hay and at a saving in cost.

A saving of about 10 per cent' may be made by grinding the grain for farm work horses when at hard labor. It requires twice as long time for horses to consume ground grain fed dry as when the same quantity is fed thoroughly dampened.

Farm work horses at hard labor should receive from 1 1-5 to 1 1-3 pounds of grain and from 1 to 1 1-4 pounds of hay per 100 pounds of live weight per day, in order that their weight may be maintained.

Satisfactory results have been secured by feeding the grain in three equal feeds and giving one half the hay at night, the other half being divided between the morning and noon feeds.

The grain fed should be redneed one half on idle days, until four days have elapsed, or until they are again put to work, when it may be again increased if desirable. By following this method attacks of azoturia were prevented.

The results of the experiment indicate that the general impression is correct that horses may very properly be given a more bulky ration when idle or doing light work than when at heavy work. It is believed that the practice of permitting work horses to gorge themselves with hay is all too common.

Care of the Horse.

See that your horse has a bed.

Watch your horse's teeth, and if he has any too long, saw them off.

Water your horse before feeding him.

Feed a draught horse 15 pounds of hay a day or less. The majority of people feed too much hay.

Don't let your horse have much water when he is over-heated.

A GREAT SCANDAL

Big Efforts to Hush the Matter Up-- The Truth Out At Last. . . .

From exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements, of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals, have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while so may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment."

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds and hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Woodbury's Liniment" failed to first relieve, and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable, immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above complaints appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Store-keeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

POULTRY.

Eggs for Profit.

It has long since been decided that the best and quickest profit from the utility flock is eggs. Therefore, great care should be used in selecting the breed you wish to handle,

Select a breed that lays well in winter. It is not always the hen that lays the most eggs in the year, that lays the greatest number of eggs in the winter.

The best winter layers are the breeds that have heavy fluff, because it keeps them warm aud comfortable in cold weather, and it is the comfortable bird that lays best.

After deciding on the breed you should get the best you can afford to buy: for the standard bred fowls eat no more than the cull. Then a pretty, even-colored flock of fowls always creates some enthusiam and you stand a very good chance of selling some eggs for hatching.

An unfertile egg will keep fresh indefinitely and by letting your customers know that you sell strictly fresh eggs or guarantee them to be fresh, you can usually get a price a little higher than the local market.

By not allowihg any cock bird with your utility flock you will get unfertile eggs.

A sick hen will not lay, so the health of the flock should be guarded with care. Keep all coops, houses and runs well cleaned.

Study the different diseases common to poultry. After you have learned to know the disease when you see it, you can soon get a treatment for each ailmen .

It makes no difference how much ground you use for your flock, it should be fenced chicken-proof, for several reasons: first, you get all the results; second, you do not lose as many fowls; third, they are not disturbed as often—the hen that is always being shooed out of the garden or flower bed doesn't lay well.

Make them a home and let them have it all to themselves. Decide on the proper house and build it for them.

Study the feed question, learn what food produces bone, feathers and eggs and feed accordingly. Raise and care for poultry scientifically.

If you intend to raise poultry for profit, study he chicken business.

Egg Eating Hens.

A short time ago nearly all the poultry magazines had questions asking how to cure egg eaters. Here is a remedy that cures. With a sharp knife pare both the upper and under part of the beak until it is down to the "quick," don't make it bleed and pare only the front end 1-4 inch back. This makes the beak tender and when she pecks at an egg shell, it hurts. Put a few china eggs in the nest for her to try it on. The beak will quickly grow out again. This has never failed to cure egg eating and the egg output is interfered with for only a day or two.

Deep Nests.

Deep nests are to be avoided, a heavy hen jumping down into a nest with several eggs in it is quite liable to break one and immediately finds the most delicious thing she has ever tasted.

International Poultry Food

Prevents Cholera and Saves the Little Chicks

A little chick is just like a little baby—its health depends on its food. Improper feeding opens the way to disease. Chicken Cholera, Roup, Apoplexy, can be prevented and cured by feeding INTERNATIONAL POULTRY FOOD.

My chickens had Cholera until some of their combs were turning black. After using a few feeds of "International Poultry Food," I never lost another fowl, and Cholera has left my premises.—J. P. Bannerman.

Give all your chickens a daily feed of "International." It keeps them well—prevents sickness—makes hens lay all the year round—keeps the cocks vigorous—and insures raising the little chicks. If you want to make money out of your fowls, feed "International Poultry Food."

25c., 50c. and $1.00 a box. At dealers everywhere. Write for free copy of our $3,000.00 Stock Book, the greatest book ever written for farmers.

Rid Your Cattle of the Fly Pest

With the warm summer days come the yearly torture of domestic animals by flies and biting insects—prevent this useless suffering by using

COW COMFORT

an inoffensive yet powerful liquid preparation that will rid your animals of the flies that swarm about them; destroys lice, ticks, fleas; cures skin diseases, scabs, tetters etc.; cleans, disinfects and removes offensive odors.

You know that animals cannot be healthy when devoured by insects—you know that quickly hogs decline in weight when they are troubled with vermin—by preventing suffering to your cattle you not only perform an act of humanitarism, but assure perfect health to your animals and profit by it in the end.

Sold in gallon cans at $2.00 each, but as the contents of a can is to be diluted in four gallons of water, it makes the price really 40cts a gallon.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

A Wasted Day.

A wasted day! no song of praise
Wells up from depths of grateful heart,
Yet others long to hear our lays,
The souls that dwell in gloom apart.

A wasted day! no kindly deed,
No cup of water, cool and sweet,
We bear to other souls in need,
Nor lead some pilgrim's straying feet.

A wasted day! no victory won,
The sword lies idle in its sheath.
If deeds of valor be undone,
How can we wear the conqueror's wreath?

A wasted day! Forbid it, Lord!
Glad service would we render Thee,
To mourners speak a cheering word.
Bless Thou the deed, though small it be.

Time is too short for wasted days,
Then let us leave no task undone,
Nor fail to lift to Thee our praise,
For by Thy help the goal is won.—
C. Louise Bell, in "Christian Work."

Shifty Shift.

It was New Year's Eve. Helmstaedter, the baker man, stepped out toward the curb; and turned and gazed with undisguised satisfaction at the sign which graced his window. It was modest in its way, done in an artistic, irregular, uphill fashion, and bordered with a neat edge of canton flannel, red as flame, stitched on. This is what it said:

! PRIZE FOR NEW YEAR.

In all of these beautiful loaves of bread, caraway seeds. In one of them, a silver dollar.

Helmstaedter nodded with approval. "Every year for fifteen years," he said to a customer who had just moved into the neighborhood, "every year for fifteen years have I done it. Every year somebody gets the silver dollar. And such a dollar, fresh from the subtreasury, and just as good as any dollar on the market. Better, mebbe. Yes, sir; fifteen years and fifteen dollars."

The customer handed out a nickel. "Gimme a loaf," he remarked, "and if you don't mind, I'd just as soon have the one with the dollar in her. I ain't particular; anything is good enough for me." He snickered at this sally, and poked the baker in the ribs. The smiling baker wrapped up a loaf and shook his head. "Ah", he said, "you make fun. You don't get no dollar. I bet you don't." The buyer did not. He took home the loaf and commanded his family to eat it up at once, in order to bring forth to light that dollar if perchance it might be inside. But the dollar was not there.

Now Helmstaedter, the baker man, from the standpoint of his neighbors, was extremely generous. He was a popular man, was Helmstaedter. Much more popular, for instance, than Tortoni, the banker, the usurer, the vulture, whose dingy, little counting house was just round the corner, and who held chattel mortages on half the neighborhood. Helmstaedter, he put bread into your mouth; Tortoni, he took bread out of your mouth—that was the way. Even on this day he had told pretty Mollie Middleditch that he must have $2.95 she owed him, or out her things must go tomorrow. And tomorrow was New Year's Day. Molly was the pride of the neighborhood, a pretty girl, who lived all alone, and she worked hard all day. She had buried her father with Tortoni's money, and her payments came too slow for Tortoni, the banker. But then Tortoni was pushing everybody at the end of the year; he wanted to count his cash after the first, and pat himself on the back for having made so much.

And when Tortoni locked up his safe at 6 o'clock and went home on the last day of the year he felt at peace with all the world, for of all the days in the year this day had been the biggest.

"Good year, John," said Tortoni to himself, after the manner of his countrymen. But Tortoni was not the only man who was well aware of his immediate prosperity. The heart of at least one other man was gladdened. This man was a young gentleman of the name of Shifty Shift. That was his real name—he had others.

Shifty Shift's hours began when Tortoni's hours were over; when Tortoni locked up, Shifty Shift opened up. And he did it in a very simple manner. For he had a key to the boarding house of John Tortoni; a key which had been made for Shifty Shift and for no one else. And after Tortoni had gone, Shifty, while the crowd passed and repassed in the evening, inserted his key in the lock of the outer door, and entered. It is simple enough when you know how. Once inside he knew well what to do and how to do it.

Half an hour later he was through, with the exception of stepping outside. Now this was a more ticklish proceeding than stepping in. For when he stepped in he could see who was outside; but when he was about to step out he was at a disadvantage. For all he knew a cordon of police might be at the next corner. However, he pulled himself together and took a deep breath. As he closed the door behind him he heard a shout.

"Hi, there!" exclaimed a stentorian voice. Shifty Shift took one look, and then ran. So did the owner of the voice.

It was a famous race. Shifty held the lead. But he and his pursuer had to contend with the crowded streets. And Shifty had to contend with the possibilities of being cut off in front, as well as being overtaken in the rear. At last he found himself confronted by two coppers on ahead, while three assailed his rear; and then he did what only Shifty Shift could do—he disappeared completely, mysteriously, uncompromisingly. They looked high and low for him, but he could not be found.

Helmstaedter, the baker man, had not yet put up his sign when all this occurred. Helmstaedter's dollar sale did not begin until 6 o'clock on New Year's Eve. Down below the bread was waiting for the psychological moment to arrive when it was ready for the oven. In the meantime the bakery force had adjourned next door to the saloon to wet its whistle against the hot and heavy baking which was imminent. Helmstaedter was puttering over his beautiful sign, when suddenly a man dashed up to his shop and almost threw himself down the basement stairs. This man had been telling himself that he was a goner; that it wouldn't do to be caught with the goods on, and had been making divers other remarks to himself which indicated that he was hard pressed. He dashed precipitately down Helmstaedter's steps. He saw instantly that he had made a mistake. There was no way out, apparently.

He heard the sound of footsteps descending to the room in which he stood. He looked about. There was no hiding place. He was surrounded on all sides by huge pans of bread. He thrust his hand into a pocket and pulled it out.

He dashed the contents of his hand across the room, and dived for another handful. Then he paused, for the man upon the steps was not a policeman. He was Helmstaedter, the baker man.

"What are you doing here?" exclaimed Helmstaedter, suspiciously.

Shifty Shift, for it was he, was relieved. "I was looking," he explained confidently to the baker, "for a man of the name of Mickey Sullivan—blind in one eye. He used to work down this cellar."

"You got in the wrong place," said Helmstaedter, "there ain't no Mickey Sullivan—not here—never was."

"Gee," said Shifty, "I got on the wrong street. Mickey works right back of here. I'm a guy f'r fair."

Casting a remorseful glance over to one side, he slowly and with becoming humility ascended the stone steps to the street. He looked up and down for a policeman. He saw none.

"Much obliged to you," he said to the baker man, as he trotted around the corner to find the imaginary Sullivan.

Molly Middleditch was sitting in her room, making over, for the fifth time, a dress which had worn out months ago, when she heard a knock on the door. She leaped to her feet, ran and opened it.

"Jimmy," she exclaimed, "Jimmy Burke." Then she stepped back a foot or two. "Jimmy," she exclaimed. "How tired you look. And how cold." Jimmy slid over to the sofa and half reclined upon it.

"Tired," he answered. "Cold! Well I guess yes. What do you think? I walked fourteen miles this day if I walked a step, and not a job; not a job anywheres. And, by George, Molly I'm up against it and no mistake. Any news?"

Molly Middleditch nodded her pretty head. "What do you think, Jimmy," she said, "Tortoni wants his $2.95, and says he'll take every stick I've got tomorrow."

Jimmy Burke gave vent to a long, low, discouraged whistle. "Gee," he exclaimed, "here is you and me, encaitched now, goin' on four year, and you with your old father knocked clean off his pins, and me without a cent and without a job, and no chance to get one. Well, what d'ye think of it, Molly girl?"

Molly smiled. "It might be worse, Jimmy," she said. "What if you didn't have me and I didn't have you?"

Jimmy Burke brightened up. "I 'spose it'll all come right some day. I wonder now if it'll ever be that you and me can get together enough of the stuff so that we can walk down to th' alderman's and get gived away in marriage, an' set up housekeepin' and have enough to eat. "Gee," said Jimmy Burke "but that reminds me. If I ain't hungry. Fourteen miles on an empty stummick ain't much in my line."

"Oh, Jimmy, Jimmy," wailed the girl, "didn't you get nothin' to eat." She fumbled about in a small purse.

"Come on out, Jimmy," she said, "and I'll blow you." Jimmy when he was sufficiently warm and sufficiently rested, accompanied her. She led him to the establishment of Helmstaedter, the baker man.

"Could you eat a loaf of bread, Jimmy?" asked the girl.

"I could eat two of 'em," said Jimmy, voraciously. The girl smiled.

"I'll lend you a nickel," she said, "and I'll buy a loaf and you buy a loaf, and we'll see who gets the dollar; and you can eat the bread."

Jimmy felt better. He took the proffered nickel. "Now no humbug Helmstaedter," he remarked, "here's Miss Middleditch, my lady friend, and me, and we're after that dollar loaf. We're goin' to buy two loaves and you'd better give me the dollar one, for I owe her a nickel, and than I can pay it back. Say, sport, can we pick out our own loaves?"

"If you have clean hands," said Helmstaedter, "you can pick out any one you please. If you have the other kind, you can pick out only one, and that one must be yours."

"Gee," said Jimmy Burke, looking reproachfully at his hands, "it's up to you, Molly. Here's wishin' that we get the dollar."

Molly picked out one. "Here's mine," she said. Then she picked out another. "And here's yours, Jimmy," she added. Jimmy's mouth watered, for he knew, even though the dollar was absent, he would have bread and caraway seeds. And the baker made good bread.

"If you get that there dollar now," said Jimmy, "we'll go to the show tomorrow night. That is, if I get it. I'll stay around all day and I'll show Tortoni and his men out if they turn up. And in the evening we'll have some fun. Might just as well. It's New Year's."

They reached the girl's room once more. Jimmy surreptitiously took a large bite out of his loaf. He could not wait. It tasted good.

THE BLESSING OF MOTHERHOOD

Healthy Mothers and Children Make Happy Homes

Motherhood is woman's highest sphere in life. It is the fruition of her dearest hopes and greatest desires; yet thousands of noble women through some derangement have been denied this blessing.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal, healthy and strong. This is evidenced by the following letters which are genuine and truthful:

London, Ont.—"I wish to thank you for the benefit I received by taking your famous medicine, Lydia E. Pinkham's Vegetable Compound. Before my baby was born I was so ill I could not stand long or walk any distance. I had to lie down nearly all the time. After I took your medicine I felt like a new woman. I could work from morning till night and was happy and well. I certainly think it relieves pain at childbirth and recommend it to every woman who is pregnant. You may use this testimonial if you like. It may help some other woman."—Mrs. FRANK CORRIN, 132 Adelaide St., London, Ont.

Brooklyn, N.Y.—"I was ailing all the time and did not know what the matter was. I wanted a baby but my health would not permit it. I was nervous, my side ached and I was all run down. I heard that Lydia E. Pinkham's Vegetable Compound was good and took the medicine. I have now a beautiful baby and your Compound has helped me in every way."—Mrs. J. J. STEWART, 299 Humboldt St., Brooklyn, N.Y.

During the summer months mothers of young children should watch for any unnatural looseness of the bowels. When given prompt attention at this time serious trouble may be avoided. Chamberlain's Cholic, Cholera and Diarrhoea Remedy can always be depended upon. For sale by all dealers.

"Go on," he said to the girl, pausing in his meal, "tear up your loaf first and see what luck you've got."

The girl obeyed. Piece after piece she tore from the fresh aromatic loaf. But no dollar made its appearance.

"Well," said Simmy, "if you ain't got no luck, I ain't. But here goes."

With a sudden dig he tore the entire inside of his loaf of bread. Then he shouted aloud with glee.

"Gee," he yelled, "I got it! I got it, Molly!"

"Jimmy," cried the girl, "that isn't a silver dollar. Its gold—gold, Jimmy!"

With frantic haste Jimmy crumbled the bread in his hand. And then with sudden ecstacy he caught the girl by the wrist and waltzed with her around the room.

In place of the silver dollar that he thought was there, there was something else. And that something else was not a silver dollar; it was not a five dollar piece—that is, not one five-dollar gold piece, but six of them, a round half dozen, nothing more and nothing less.

Sprains and Strains.

Sprains and strains are the result of the forcible over-stretching of the muscles, tendons and tissues. This very commonly occurs in the neighborhood of a joint, such as the ankle or wrist, from the effect of a wrench or twist. Great pain is then felt at the moment, sufficient to produce temporary faintness or sickness, and the part becomes rapidly swollen and hot. In a few days the swelling gradually subsides, and usually some discoloration appears under the skin, the colour changing after a time from red to various shades of greenish-blue and black. In many cases in which the swelling and pain have subsided there is still left a stiff feeling in the joint, and a long time may elapse before the parts move freely. Treatment.—It is advisable when there is great swelling in a joint, such as the wrist, knee, ankle, or shoulder, to send for a doctor. Often a bone may be broken when the blow has been a very severe one; this may be hidden by the swelling. For a simple sprain or strain, bathing first with very hot water, then with cold, alternately, helps to prevent great swelling, also allays the pain. The affected part should then be put to complete rest, with a cloth wrung out of some evaporating lotion over it. A simple and cooling lotion can be made of three parts methylated spirits and one part water. If the pain continues, a hot fomentation may be applied. In some cases heat gives relief, in others cold. It is advisable to use just what is the most comfortable. A bandage applied with moderate pressure will sometimes prevent excessive swelling. This cannot always be done, as the part is too painful. A bandage should be worn for some time after the joint has begun to be reset. This gives it support until the muscles are strong again.

He Was A Gentleman.

A few days ago I was passing through a pretty, shady street, where some boys were playing at baseball. Among their number was a little lame fellow, seemingly about twelve years old—a pale, sickly looking child, supported on two crutches, and who evidently found much difficulty in walking, even with such assistance.

The lame boy wished to join the game for he did not seem to see how much his infirmity would be in his own way, and how much it would hinder the progress of such an active sport as base ball.

His companions, very good-naturedly, tried to persuade him to stand at one side and let another take his place; and I was glad to notice that none of them hinted that he would be in the way, but that they all objected for fear he would hurt himself.

"Why, Jimmy," said one of them at last, "you can't run you know."

"Oh hush!" said another—the tallest in the party; "never mind, I'll run for him," and he took his place by Jimmy's side, prepared to act. "If you were like him," he said, aside to the other boys, "you wouldn't want to be told of it all the time."

As I passed on I thought to myself, "that boy is a true gentleman."

Look at the label

when you buy a varnish. The can with the "Cover the Earth" label contains a varnish made from the purest materials properly selected and aged to give long and satisfactory service. There is a special Sherwin-Williams Varnish for every use.

SHERWIN-WILLIAMS PAINTS & VARNISHES

THE SHERWIN-WILLIAMS CO. of Canada, Limited, Montreal, Toronto, Winnipeg, Vancouver

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day, as you may not see this offer again. Address:

EMPIRE LINIMENT

advertised and tried it, after every known Liniment and Rheumatic cure. Here I am to-day, sound and well, after using only a few bottles. I recommend it to all sufferers. Don't be without it.

C. H. PURDY.

If you are a housewife you cannot reasonably hope to behealthy or beautiful by washing dishes, sweeping and doing housework all day, and crawling into bed dead tired at night. You must get out into the open air and sunlight. If you do this every day and keep your stomach and bowels in good order by taking Chamberlain's Tablets when needed, you should become both healthy and beautiful. For sale by all dealers.

Flour and Breadmaking.

Although flour is one of the most common materials used in the preparation of our foods, very few people have a clear idea of the wide difference between the flour-producing properties of the various varieties of wheat grown in different localities, of the effect of climate, soil, etc., and of the different grades of flour on the market. To many people flour is simply flour, and they know no grades, unless it is simply two kinds —bread and pastry flour. As a matter of fact, there are a great many grades of flour; and, while the millers, particularly those in the larger milling concerns, strive to keep the different grades of flour uniform from year to year, there are wide differences in the quality of the wheat, which is their raw material, that renders this problem a very difficult one, if not impossible. Consequently, the flour got under any one grade is very likely to vary somewhat in strength, or in some of the conditions which would affect the baking. By blending wheats of different grades and varieties of different qualities the miller may be able to produce a uniform sample of flour, but in certain seasons this may be a very difficult problem. Very often the millers are blamed for producing poor flour when the circumstances that effect this are beyond their control.

CIRCUMSTANCES INFLUENCING THE QUALITY OF WHEAT.

There is abundance of evidence to prove that the composition of wheat is influenced by its environment. Millers are quite familiar with the fact that some districts in Ontario will produce a better quality of wheat than others, and that the spring wheat of the Western Provinces is superior to the best Ontario can produce. Possibly climate (including variations due to season) and soil, or, rather, the condition of the soil, have the greatest influence on the composition of the wheat. To obtain a good quality of wheat for milling purposes we require bright, warm days, with an abundance of sunshine and an absence of an excess of moisture; or, in other words, the conditions which would cause rapid, though normal, ripening of the grain. Wheat that has ripened slowly, or that is over-ripe, is usually somewhat low in protein, and, consequently, in gluten, and rich in starch. Chemical investigations seem to show that at the time of blossoming the plant has taken up nearly all the nitrogen and ash constituents that it will have in the matured plant, while it continues to keep up carbon as long as the plant is green. This means that the longer the time from blossoming to maturity the greater the opportunity for the plant to take up carbon and convert it into starch and store it in the grain. Consequently, slowly matured grain will be plump. The amount of protein, or gluten, is determined by the amount of nitrogen taken into the plant in the early stages of growth, and the completeness with which this is transferred to the seed.

A comparatively high temperature, long, bright days, an absence of an excess of moisture, are the conditions which prevail throughout our Western Provinces, and these are, doubtless, some of the conditions that account for the high quality of wheat produced there.

The researches of Laws and Gilbert at the Rothamsted Institution, in England, and of the Central Experimental Farm at Ottawa, show that manures have very little influence on the composition of the wheat. Recent investigations by F. T. Shutt, Central Experimental Farm, Ottawa, show that the amount of moisture in the soil is a greater factor than the amount of nitrogen available to the plant. These investigations indicate that when wheat is grown on two different soils, one of which contains more moisture than the other, the moist soil will produce grain with low glutten and high starch content. This is probably due to the fact that in this case maturity is retarded. It will thus be seen that the wheat from the same localities and of the same variety may be quite different in composition and in milling qualities. Furthermore, it is well known that the wheat from some localities in our Province is very much superior to the same variety of wheat grown in another locality. Thus, without going too deeply into this point, it will be seen that wheat is not of a constant composition, but that it varies from season to season and in different localities. The composition also varies very widely with different varieties.

VARIETIES OF WHEAT.

Wheats are commonly divided into two great classes—those sown in the autumn and harvested the next summer, known as fall or winter wheats, and those sown in the spring and reaped the same season, known as spring wheats. As a rule, the spring wheats are harder, and make a superior flour for breadmaking purposes. There are a great number of varieties of these two different classes of wheats, which vary very much, not only in the yield of grain and straw per acre, but also in milling and baking qualities.

Some of these varieties are very soft, and yield a poor quality of flour. Unfortunately, these soft wheats usually produce more bushels per acre than the harder, better wheats; and, as the buyer makes very little difference in the price, it naturally follows that the softer, heavy-yielding varieties are grown in largest quantity. We have milled and baked over sixty varieties of fall wheats grown on the college experimental plots in each of the seasons of 1907, 1908, and 1909, and also over forty varieties of spring wheats, grown the same seasons. The results of these tests are too voluminous to incorporate here, but they may be found in the Ontario Agricultural reports for 1908 and 1909

To the Ontario miller the question of the varieties grown in his own district is a very important one, for the greater part of this wheat will probably be delivered at his own mill; and, if the varieties are poor ones, his difficulties in manufacturing a strong flour are increased. Fortunately, there are not a great number of varieties grown in the Western Provinces, and the mixing in transit makes the wheat of more uniform grades than could possibly be done in this Province. —R. Harcourt and Miss M. A. Purdy.

(to be continued.)

Swat the Fly.

Begin war early on the housefly. Why? Because that apparently helpless little fly is one of the greatest distributers of death known at the present time. If you begin war on this pest early enough there will be less sickness this summer. Clean up the rubbish. Arrange for the removal at once of manure, and keep it in a dark place until you can remove it. In planning farm buildings do not build the stable too near the house.

The fly lives on dirt, rubbish and filth. then enters the house and spreads bacteria and disease all over your Sunday dinner. It doesn't confine itself to the Sunday dinner, but spreads disease over all the other meals in the other six days of the week. In fact there is no limit to the wanderings of the housefly. Swat the fly every chance you get. If you don't the fly may swat you with disease, and possibly death.

LITTLE BOY WAS SUDDENLY TAKEN

WITH

DIARRHŒA

and VOMITING

If you are suddenly taken with Diarrhœa, Dysentery, Colic, Cramps, or Pains in the Stomach, Cholera Morbus, Summer Complaint, or any Looseness of the Bowels, do not waste any time, but immediately procure a bottle of Dr. Fowler's Extract of Wild Strawberry, and it will cure you in no time. Mrs. H. L. Steadman, Pleasant River, N.S., writes: "A year ago this fall, my little boy was suddenly taken ill with diarrhœa and vomiting, and as our doctor is ten miles distant, it seemed as if I could not get help soon enough, but on going to the country store I purchased a bottle of Dr. Fowler's Extract of Wild Strawberry, and after the first dose could notice an improvement, and the next day the child was better and regained health. Since that time I always keep it on hand."

Insist on being given "Dr. Fowler's" when you ask for it. Price 35 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

For Sale

One of the fastest and handsomest 5 year old black geldings in the province for sale or exchange for an express horse. He is sound and kind and is not afraid of anything.

Also a 500 lb. Cream Separator (new) for sale. Apply to

Children Should Not be Nuicenses.

We as mothers want our children loved by others, but we cannot have them loved unless we give them careful training from infancy. There is a vast difference in the dispositions of children; this is true even in brothers and sisters, but all can be trained by patience and firmness and curbed in any unlovely trait of character by proper care.

There is no use in loud-voiced scoldings and wrangles from the mother. Children soon come to recognize this as unmeaning, and, while it jars on a sensitive child's better nature, they become accustomed and indifferent to this kind of teaching, and worse still, will indulge in the same kind of discord among themselves. Some mothers seem to think that their children are so near perfection that they need no correction, and that everything they do should be accepted by outsiders as altogether lovely.

Not long since a lady with several small children called to see me. The Marechal Neil rose, the pride of my possessions, was in all the glory of its first spring blooms. Those children jumped on that rose and pulled every bud and blossom that they could reach, without one word of reproval from "mamma." The afternoon was spoiled for me, and I could almost have it in my heart to say I never want them to come again.

Years ago, when I was teaching school, I boarded in a house where there were several children, and while I have loved children all my life, I do not believe it was in human nature to have loved those children. As soon as I would reach the house in the afternoon they would flock around me, climb over my lap, bring their primer for me to hear their lessons, question me to their heart's content, and torture me in other cute ways, all with the full knowledge and consent of their mother. They were allowed to sleep with me, and, when I found it unbearable and quit boarding there, the father tried to take the school away from me.

This is certainly a children's age, but I shudder to think of what the next age will be, unless parents wake up to the present situation and take the reins of government in their hands instead of turning them completely over to the youngsters. I love children, but I do not love nuisances, nor does anyone else.—J. H. Rust, in Grain Growers Guide.

"Bad Luck" With Bread.

There are several causes for "poor luck" in bread-making. It may be due to poor flour or yeast, temperature before or during baking, or to improper care.

Ifthe wheat has been allowed to sprout or mildew before being made into flour, the bread will not be good. Flour from sprouted wheat does not contain enough gluten. This causes the bread to have a coarse look, with large airspaces. Good bread should have many small, even air spaces. If the flour is from mildewed wheat, the bread soon becomes musty. Good flour is shown by its creamy-yellow color. Or take a handful of flour and squeeze it. If the flour retains the print of the fingers, it is good bread flour.

Sour bread is caused by weak yeast or by foreign bacteria in the yeast.

Bread dough should be kept at a temperature between 75 and 80 degrees F., while rising, to obtain the best results, When double its bulk, it should be put in the oven. If the oven is not hot enough, the bread rises too much. When too hot, a crust forms on the bread too soon. This frequently prevents the centre of the loaf from being well baked. The yeast-plants, not being destroyed, produce fermentation here.

The oven should be about 280 degrees F. when the bread is put in. The bread should remain in the oven from forty-five to sixty minutes when in single pans.

After baking, the bread should be laid on a rack until thoroughly cooled. Keep in a dry, tin box.

Where two or more loaves are baked in one pan, the loaves do not have a good crust. They dry out much more quickly.—Kansas Industrialist.

Will you be one of the 108 farmers who will receive our Prize Contest checks?

THERE will be twelve cash prizes in each of the nine provinces (108 in all) in the 1912 Prize Contest for Canadian Farmers. The 1911 Contest was so successful in awakening interest in the use of Concrete on the farm, that a second contest, in which three times as many prizes are offered, was decided upon for this year.

The Contest this year is divided into three classes, "A," "B" and "C," and there will be four prizes in each class—First prize, $50; Second prize, $25; Third prize, $15; Fourth prize, $10.

Thus there are three $50 Prizes, three $25 Prizes, three $15 prizes, and three $10 Prizes, *for each province.*

DESCRIPTION OF CLASSES

In Each Class there will be First, Second, Third and Fourth Prizes ($50, $25, $15, and $10) for Each Province.

CLASS "A"—Prizes to be awarded to the four farmers in each province who use most "Canada" Cement on their farms in the year 1912.

CLASS "B"—Prizes to be awarded to the four farmers in each province who send photographs of the *best concrete work* done with "Canada" Cement on their farms in 1912.

CLASS "C"—Prizes to be awarded to the four farmers in each province who send in the best *description*, telling how any piece of concrete work was done with "Canada" Cement. (Entries for this prize must be accompanied by photographs of the work.)

Don't think that you must use a large quantity of cement in order to win a prize. The quantity of cement used does not count in Classes "B" and "C." Many of last year's prize winners used very little cement.

When you enter the Contest, you have a chance to win a cash prize of $50 as well as the certainty that you will add a *permanent improvement* to your farm. If you haven't a copy, be sure and ask for our book, "What the Farmer Can Do With Concrete." It will not only suggest many improvements that you can use in entering the Contest, but will tell you all about the use of concrete on the farm.

Just write your name and address on the attached coupon, or use a postal card, and we will send full particulars of the Prize Contest and a copy of "What the Farmer Can Do With Concrete" to you absolutely free.

The Farm Homestead Water Supply.

(Continued from page 675.)

sincerely think that a better day has dawned and that those who may write on this subject ten years hence will have a brighter story to tell than that which I can bring before you to-day. But to secure this the work of education must continue. Indeed, there is no better time than the present to carry on a campaign for purer water on the farm; much of the preparatory work has been done and there is an ever increasing number of intelligent, thinking men going on to the land who will be willing to receive and act upon advice from those who are qualified to give it. In this good and very important work this Association may render most valuable assistance and I trust that we, who are practically interested in this problem, may have your hearty co-operation and assistance. When we rememeber that 61 per cent. or over of our population are upon farms, that the water supply on these farms stand greatly in need of improvement, we shall realize there is a great field for useful, educational work—much of which I believe can very well be done by and through this Association.

Twenty-four years ago when I entered upon my present work, having then had some experience in the examination of water supplies, I became interested in the farmer's well and at once determined to make the investigation of the farm water supply one of the features of our work. Our authorities being agreeable, I was able to offer a free analysis and report on waters from farm homesteads, from creameries and cheese factories, provided the samples were collected and shipped in accordance with our instructions, that express charges on the sample were prepaid and that full information resecting the well and its environment were furnished. To ensure our receiving the particulars required for the proper interpretation of the analytical data, a form containing a number of questions is sent to each applicant, with the request that it be filled in and returned when shipping the sample. The result of this privilege extended by the Dominion Government has been the reception and analysis in the farm laboratories of several hundreds of samples each year. At first there was but little response, the farmers did not realize the importance of the information we could give them and the larger number of those who wrote for our directions did not send forward a sample thinking, I suppose, that the game was not worth the candle, that the trouble and expense in connection with the collection and shipment of the water exceeded the value of a knowledge respecting the real character of the water they were using. But as the years went by and our propagandic work on the subject became more widely appreciated and the number of samples increased, so that now scarcely a week goes by without our receiving several farm waters for analysis. This I take it is very encouraging.

Our practice is to submit each sample that is forwarded according to directions to a complete sanitary analysis. A bacteriological examination is unfortunately out of the question, owing to the length of time that must necessarily elapse between the collection of the sample and our reception of it, for these waters may and do come from as far east as Prince Edward Island, and as far west as British Columbia. In our report to the sender we give the full analytical data followed by what is of more importance to the farmer, a fairly detailed discussion of the character of the water and the nature of its impurities, if such have been detected. It would, of course, be far more satisfactory if the water analyst could personally visit the farm and inspect the source of the supply, but that of course, is impossible in this work. We must bring experience to the task and carefully consider the data in the light of the information furnished. My opinion is that in very much the larger number of cases we arrive at the truth, but I confess we occasionally obtain results incapable of decisive interpretation.

Any detailed account of our analytical results and their interpretation is impossible in this paper, which, of necessity, is ,imited to a brief survey of the work. As, however, this material is to be found in the annual report of the Chemical Division of the Experimental Farms—the omission here is not a serious one. Reviewing the results obtained since 1887, we find that of the waters so examined 30 per cent. have been classified as safe and wholesome, 25 per cent. as suspicious and probably contaminated, 36 per cent. as seriously polluted, and 9 per cent. as non-potable through high salinity. From year to year these percentages will varysomewhat, thus of waters ranking first class, the lowest percentage in any one season was 22 and the highest 40. In 24 years the proportion of good waters exceeded 30 per cent. in eight seasons only. We do not claim that these results represent the condition of the farm supply in general throughout the Dominion. It might be urged that only those who have reason to suspect their supply, either through illness in the family or strong objectionable features in the water itself, are forwardind samples for analysis. It mibht be pointed out, however, on the other hand, that there is a very large class which appears to be totally indifferent as to the quality of water they use and who do not think it worth while to have their well water examined. Of these waters, we may well suppose there is a large proportion positively unsafe for use. As we must be all aware, the farmer has been accustomed to judge of the suitability of a water for drinking purposes by its temperature, appearance and odor or absence of odor, and we know how very fallacious such signs or qualities may be at times. In the absence of features that make the water objectionable to the senses, the source by the larger number of consumers is considered satisfactory, and there is no effort made towards learning its true condition. Many such waters—clear, brilliant and odorless drawn from far wells and hitherto quite unsuspected of impurity, have been shown by analysis to be most seriously contaminated.

If the proportion of wholesome, safe-for-drinking waters used on the Canadian farm does not exceed one-third of the whole we have certainly a sufficiently serious condition to warrant a strong effort being made towards improvement. In this matter I believe we have been very conservative, under rather than over estimating the proportion of dangerous waters in use.

And now we must briefly enquire as to the nature of these supplies and the cause of their contamination. On the larger number of farm homesteads we find these supplies are shallow wells— wells dug to a depth of from 5 to 30 feet. These are located in the barnyard, where there is unavoidably more or less accumulation of manure, or under the barn or stable, or in more or less close proximity to one or other of the farm buildings containing stock, or at no great distance from the privy—frequently a mere hole in the ground—or lastly, close to the back door, out of which the household slops are thrown and near which only too fre-

GREATER ST. JOHN EXHIBITION!

Boom City's Show This Year To Eclipse All Others

PRIZE LISTS

SECRETARY H. A. PORTER WILL SEND YOU a Prize List upon application. This valuable piece of literature contains everything you may want to know about the big Show.

AGRICULTURISTS AND STOCK BREEDERS will find the list fully explanatory of the various classes of exhibits in their departments and the prize monies to be given in each.

RULES AND REGULATIONS GOVERNING THE SHOW, the matter of Entrance Fees, the days for Judging, Applications for space, the care of Cattle, and the showing of the Live Stock are also explained.

SEND FOR THIS BOOK AT ONCE if you intend to be an exhibitor —whether it be Live Stock or even in the Fancy Work department, we will send it to your address immediately.

quently vegetable and animal refuse are allowed to accumulate and decompose. Thus, health is jeopardized for convenience. For a few years after the homestead is established the water of such wells so located may remain good; but sooner or later the soil surrounding the well becomes saturated with organic filth and, unable longer to perform its useful work of filtration and purification, allows the water percolating through it to carry its load of manurial matter to the well. Inevitably these wells become polluted; we have yet to find one on a farm ten years in operation furnishing a pure, first-class drinking water. Some farmers take pains to protect the mouth of the well against surface wash, and the entrance of rats, mice and frogs, which so frequently find a watery grave in the farm well, and, again, others line the well to a depth of 5 or 10 feet with puddled clay or concrete. Both plans are to be recommended as safeguards, but they will not remove the objection to shallow wells placed in proximity to sources of contamination. These precautions are altogether insufficient in the larger number of instances to prevent the infiltra- of organic filth, as we have often been able to prove. Many suppose, because these barnyard, back-door wells never go dry, that they have a spring, but such is very seldom the case; undoubtedly the great majority of such we merely receive soakage and are supplied from the rain and snow falling on the immediate surroundings. Such, briefly, is the condition of affairs; can it be remedied?

There is probably no better watered country in the world and we can unhesitatingly affirm that our natural waters, of lakes, streams and springs are of the purest. If time permitted I could present ample proof of this statement. These sources might be used to a greater extent than at present. Our deep seated waters also for the most part are organically pure and this is the source that the larger number of our farmers must look to for their supply of good water. The driven or drilled well, so located as to be beyond the possibility of local contamination, is the solution of the problem for many; it is the well that experience has shown to yield the safest water. A careful survey of the farm should be made with the special object of locating the well, having in mind the practicability of piping the water to the house and buildings. But this is a phase of the subject which I cannot here enter upon. My principal object in writing this paper was to call your attention to the quality, the character, of the water as found today on our farms, in order that we might, by a more active campaign, bring about a better condition of affairs. We want to urge the abandonment of the shallow well located in the barnyard or in the neighborhood of the farm buildings. We want our people to know the danger to health that lurks in the water containing putrescible, excrementious matter. They should be told of the ease with which such wells become infected with the germs of disease, how frequently the waters of such wells are the means not only of causing diarrhoea and and other forms of intestinal derangement, but of disseminating that fearful scourge of country and city alike, typhoid fever, the disease that stands out as the most serious and fatal of water-borne diseases in this country. May I not venture to hope that in assisting towards the establishment of a good water supply on the Canadian farm homestead, the Canadian Public Health Association may find a fruitful field for work. By a vigorous propaganda, by the collection and tabulation of statistics, by the personal influence of its members and in many other ways, the Canadian Public Health Association can, and I have no doubt will, take a very active and important part in our crusade against the impure water supply on the farm homestead.

FLORICULTURE.

H. P. O. N. S. writes:—Is it an easy matter to grow Stocks from seed? I have had poor success for several years. I sow the seed in boxes, in the kitchen, about the first of April. They usually come up all right but about the time you think you are going to have a fine lot of plants they fade away, almost simultaneously, as it were in a night. I have also had somewhat the same experience in my Aster hot beds. What do I do that is wrong? What is the best shrub for a low compact hedge?

Every one has the same trouble with Stocks unless the ventilation is good. The florist calls this trouble damping off and ascribe it to surplus investure and stagnant atmosphere; the latter is the especial cause. These plants will not fail if there be a current of air blowing over them, therefore keep the boxes of seedlings as near the light as possible and during their critical period when between the first and second leaf give all the fresh air that the temperature will permit. The same treatment would of course apply to the Aster. The best shrub for a low campact hedge is the Berburis Thumbergie a Japanese Berbery. It is absolutely hardy, very pretty and so close and thorny that a dog will not go through it.

Inquirer, of St. John, writes:—When shall I plant seed of Scarlet Runner Bean next year as I want to cover a fence? What would you think of planting a row of Castor Oil Beans with the idea of making a mass of foliage to cover the high foundation of a house? What sort of a plant is the Golden Elder, is it a good border plant?

Plant the Scarlet Runner Seeds about the first week in May. You will find the Castor Oil Plant a disappointment for covering purposes unless we have a very warm summer. The cool nights in St. John check the rank growth that prevails further south. Hardy Larkspur is more permanent and better adapted for covering unsightly places.

The Golden Elder is a yellow beaned shrub of somewhat rank growth. One would infer from your remarks as to ordering that you mean the Golden Feather (Pyrethum), an annual easily grown from seed and which grows to a height of six inches and should be kept clipped. Repot house plants, that are pot bound' and cut back straggling winter growth on Geraniums, Fuchsias, Heliotropes and plants of this class.

Potash From Seaweed.

Relative to the extraction of potash from kelp or seaweed in the United States, the British Vice-Consul at Ensenada, Mexico (Mr. W. D. Madden) has forwarded a newspaper extract from which it appears that the kelp growths already exploited along North Pacific coast of America can be made to yield from two to three times as much potash as is now imported into the United States.

These huge seaweeds, the article states, form "groves" exceedingly dense, some of these along the Pacific coast being five miles long and two miles wide. ihey are rooted at the bottom among rocks, their stems being sometimes as much as 300 feet long, and bearing at their tops great air-filled bulbs with which serve as floats supporting enormous fronds of steamer-like leaves. From the ocean water they take up large quantities of potash salts, the dried plants containing from 25 to 35 per cent. of their weight of potassium chloride, which is easily extracted. They also contain iodine, and it is thought that this and other by-products would pay the cost of extracting potassium chloride. All the groves are within the three-mile limit. If properly protected, they will yield indifinitely, renewing themselves by fresh growth each spring. The "heaviest" growths are south of Point Sur, but large ones extend as far north as Seattle.

The available output of potassium chloride from this source is estimated by the United States Department of Agriculture as equivalent to the value of $40,000,000 (about £8,222,000) per annum.

World Protection of Fertilizers.

By a glance at the enormous quantities of artificial fertilizers employed in the world one can get a good idea of the general process of agriculture. The figures cannot be more than approximate, but they serve to show how dependent agriculture has become upon the fertilizer industry.

1. PHOSPHATE OF LIME.—The total production is estimated at about 10,000,000 tons, of which 8,000,000 may be attributed to superphosphate, and 2,000,000 to basic slag. This does not include the large quantities contained in guano, bones, &c.

2. POTASH SALT-.—The Stassfurt mines deliver potash salts in different forms equal to about 500,000 tons of our potash.

3. NITRATE OF SODA.—The shipments of this commodity from Chili amount to about 2,000,000 tons a year, of which it is roughly estimated that three-fourths are for agricultural and one-fourth for chemical industries.

4. SULPHATE OF AMMONIA.—The total production approaches 1,000,000 tons a year, which is employed for agricultural purposes.

All of this fertilizing material is transformed by process of cultivation and nature into supplies of food for mankind and stock; yet experts tell us that, as time goes on and cultivation becomes generally more intensive, it will be necessary to employ far larger quantities of fertilizers. Will the supply equal the demand? There are already indications that prices are moving up, because the supplies are not keeping pace with the inquiries.

In a very carefully written article appearing in one of the late bulletins from the Central Experimental farm, Ottawa, Prof. J. H. Grisdale gives several rations which he has tried out with splendid success in the matter of ensilage feeding.

He states that corn silage and straw or chaff, while together making up a most excellent foundation or base, do not alone constitute a well-balanced or suitable ration for any class of livestock. For feeding heifers or young stock some bran and clover hay should be added. A suitable ration would be as follows:

For yearling heifers—Corn silage, 25 to 35 pounds; straw or chaff, 4 to 6 pounds; clover hay, 4 pounds; bran, 2 pounds.

For dry cow—Corn silage, 50 to 60 pounds; straw, 8 to 10 pounds; clover hay, 4 pounds; bran, 1 to 2 pounds.

For cow in milk—Corn silage, 45 pounds; straw, 6 pounds; clover hay, 4 to 6 pounds.

Meal mixture—Bran, oats, gluten or oil-cake meal, or cotton-seed meal, equal parts. One pound meal to three or four pounds milk produced per day.

For steers running over winter 1,000 pounds weight—Corn silage, 60 to 75 pounds, straw 8 to 12 pounds; clover hay, 2 to 4 pounds.

For fattening steers (1,000 pounds)—Corn silage, 50 to 60 pounds; straw, 6 to 10 pounds; hay, 3 to 6 pounds. Meal—Starting at one pound go up to 10 pounds per diem.

A good meal mixture would be corn, bran, barley and oil-cake meal, gluten meal or cotton-seed meal. Take bran and corn, bran and barley, equal parts, or bran, corn and barley, equal parts, to which add an amount of any one of the last three equal to ene-quarter of the total weight of the meal mixture when ready to feed.

GAVE UP ALL HOPES OF EVER GETTING WELL

Mr. Jacob E. Herr, 111 Grange St., Stratford, Ont., writes:—"Ten years ago I suffered with a very peculiar disease. I would go to bed feeling as well as could be, and after sleeping for five hours I would wake with a severe pain in my back, then moving into my side and breast. The pain was so terrible I could not lie in my bed, and usually had to sit until mo. .ing with a pillow propped up behind my back. With all my pain I would go to work, and after working up to about 10 o'clock the pain would leave me entirely. The same thing would happen the next night, and every night for two years. I tried four different doctors, but none of them did me any good. I tried a great many patent medicines, but all of no avail. I gave up all hopes of ever getting well. A friend persuaded me to try Milburn's Heart and Nerve Pills. I bought four boxes, and after using the first one I felt a change for the better, and after using three boxes I could sleep all night. The pains were gone, and I was completely cured.

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Put T-A Wheels On Your Wagons---

These Wide-Tire Steel Wheels are so constructed that they roll smoothly over the roughest roads, without tiring your horses. And they are absolutely accident-proof—yet cheaper than ordinary wooden wheels.

T-A Wide-Tire Steel Wheels and Handy Farm Wagons

Our Handy Farm Wagons are built low making them easy to load and unload—and are especially designed to meet the requirements of the man who wants a light, strong wagon for all kinds of work on the farm.

A Guide to Agriculture.

By direction of the Hon. Martin Burrell, Minister of Agriculture, a timely bulletin on bee-keeping has been issued by the Federal Department of Agriculture. According to a statement of the author, Dr. C. Gordon Hewitt, Dominion Entomologist, this work has been prepared to meet a very persistent demand for information by persons who wish to learn how to begin and to continue the industry of agriculture. It was the further object of the author to increase the number of bee-keepers in Canada by indicating the advantages of bee-keeping, It is pointed out that bee-keeping returns the direct profit of a honey crop and the indirect one of improvement to yields of cloverseed and fruit. It is observed that a bullock after fed and cared for during an entire winter will not realize much more than the produce of a colony of bees in a single season.

Beginners are recommended to start on a small scale with one or two hives increasing the number annually as experience is gained. This covers, in plain language, the whole field of Agriculture, including equipment, management, the production of honey and wax, diseases, legislation of the various provinces against bee diseases, etc. It is designated "The Honey Bee," Bulletin No. 2, Division of Entomology and No. 69, Experimental Farms. Copies may be had free by applying to the Publications Branch Department of Agriculture, Ottawa.

Importation To Great Britain Of Canadian Horses.

The Department of Agriculture at Ottawa is in receipt of a new Order by the Board of Agriculture at London, England, entitled "The Horses, (Importation and Transit,) Order of 1912."

In Chapter 1 of this Order provision is made for the detention and testing with mallein, on and after January 1st, 1913, of all horses, asses and mules landed in Great Britain from abroad, except such as may be exempted for special reasons under licences issued by the Board. It also contains provisions designed to prevent the introduction of various equine diseases, as well as glanders, such as Dourine, Mange, Straugles, Ringworm, etc.

Chapter 2 of the Order deals with the carriage of horses, asses and mules by water, and lays down requirements as to fittings, etc., of vessels on which such animals are carried to or from any port of Great Britain, and Chapter 4 relates, inter alia, to the cleansing and disinfecting of such vessels,

The Order, except Chapter 1, will come into operation on July 18, 1912.

Can You Invent a Beet Puller and Topper?

The Great Western Sugar Company, of Denver, Colorado, has offered a prize of $10,000.00 to be awarded for the complete solution of a practical Sugar Beet Puller and Topper under certain conditions outlined in a circular which they will forward to anyone who may be interested enough in the proposition to send for it. The contest is open to the general public and the offer will be in force until the first day of March, 1915.

The machine must conform to and meet the following specifications:

1. The motive power required for different soil and weather conditions must not be excessive, that is, not to exceed four horses per beet row if the animal power is used.
2. The device must pull and top all the beets and separate beets and tops and leave beets and tops convenient to load. It is especially understood that the work may be done by two machines of which one does the topping, the other one the pulling, or vice versa, although a combined machine is preferred. The pulling and topping must be done in a satisfactory manner.
3. The steering and turning of the machine or machines must be easy and practical. The Beet Puller and Topper must be adjustable for rows spaced 16 to 20 inches apart.
4. The operation must be such that damage to the beets or tops will be avoided as much as possible.
5. The machines must fulfil the above conditions regardless of the size of either beets or foliage, and be practical in the varying types of beet lands.
6. The machines must be durable and reasonably simple, and the different parts easily replaced.
7. The selling price of the machine or machines to the public by the local dealer, whether combined or otherwise, shall not exceed $300.00 if the motive power is animal power, and shall not exceed $500.00 if self-propelled.
8. The Committee of Judges shall have the right to alter, modify, or set aside the above specifications at their discretion.

When to Feed Bran.

Bran is rich in phosphates when compared with many other foods fed to poultry, and as phosphates account for the formation of bone, growing poultry, may with advantage be allowed a certain proportion of it. It is also useful for laying hens and if used occasionally as a change and to add bulk to the morning mash the fowls will be greatly benefited by it.

In using bran, however, it should never be mixed with other meals in a dry state as such a mixture is liable to set up a derangement of the digestive organs owing to its irritating nature. Bran before being used should be scalded with boiling water and left for an hour at least to cook and swell. A little may then be added to the soft food of growing chickens, or it may be used for laying hens in conjunction with meal, using equal parts of each and driving off by the aid of shorts. A mash thus made is suited for use in summer.—W. R. Gilbert.

We have received a copy of the Calendar of the Collegiate and Business Academy,, (formerly Horton Collegiate Academy) of Wolfville, N. S. It is an exceedingly well printed book, attractive inappearance and containing much valuable information for parents who contemplate sending their boy to a high class residential school.

From the contents we note that four regular Diploma Courses are given, viz: (1) College Preparatory, (2) General, (3) Manual Training, (4) Business, including Stenography and Typewriting.

The Collegiate course prepares for University Matriculation in Arts, Sciences, Engineering, Dentistry, Medicine, etc. All work is carried on under experienced teachers according to the best methods. The expenses are very moderate considering all the advantages offered. The enrollment last year was 189. This institution is now entering upon its EIGHTY FOURTH YEAR of successful work in the education of boys and young men.

A copy of the illustrated Calendar will be mailed free on request. Apply to W. L. Archibald, Principal.

"HUNDREDS OF FARMERS, WHO HAVE USED

MOLASSINE MEAL

and are at the present time using it, can tell you that it is all that we recommend it to be. YOU may be one of the few who are not using it. If not, buy a bag now. For Horses, Cattle, Pigs, Sheep and Poultry, it is now acknowledged to be the best Feed obtainable."

Ripening Honey.

The proper ripening of honey, that is to say, bringing it into that condition before putting it on the market that there shall be no risk of its fermenting afterward, is now recognized by every commercial bee keeper as of the very highest importance, both to the individual and to the industry generally. All who have paid any attention to the matter know that honey, whether what is termed ripe or not, contains a certain percentage of water, which may range from 12 to 25 or 26 per cent. At anywhere near the lowest percentage it would be quite ripe, and while unexposed to a moist atmosphere would remain undeteriorated for any length of time; but honey with the highest percentage of moisture in it would ferment in a very short time in a closed vessel.

Honey, when first gathered, usually contains a high percentage of moisture, and it is believed that the bees on their way to the hive do in some manner get rid of some of the excess. Much, of course, depends upon the weather at the time the honey is gathered; in dry weather there is much less moisture in it than in damp or wet weather. In all cases the cells in which honey is stored remain unsealed until by the heat of the hive the excess of moisture evaporates and is driven out of the hive; they are then sealed and the honey is deemed ripe. Seeing how difficult it is for a human being to decide when this stage is reached, and the appliances necessary to guide him, it has always been a puzzle how the bee so unerringly decides this question so vitally important to its economy.

The beginner will, no doubt, find it greatly to his advantage, until he has gained sufficient experience to enable him to grasp all the preciseness of the various phases of bee--keeping, to ripen his honey inside the hive; that is, to allow the bees to do so.

Farm Paper is Valuable Literature for Broadening Influence.

A minister of the gospel has given forth the opinion that all preachers should know something about farming, and goes on to say that every pastor should read a good farm journal for its broadening influence. Now what do you people who think farm life narrow and uninteresting think of that? Of course some of us have always considered a good farm paper broadening and uplifting, and we are rejoiced that other people, ministers and professional men and such, are beginning to get inti line with really good and uplifting literature, such as is found in a first-class farm paper. At the present time farm papers have to be first-class and broadening and progressive in order to satisfy the demand of farm people for good agricultural literature. They have to be clean for the reading of the boys and girls in the farm home, and they have to be free from the yellow "atmosphere" found in so many big city dailies, and they have to furnish the information and the inspiration and the intellectual stimulus that the times demand. That is why farm papers are beginning to take first place in the ranks of good reading; and that is why they are being read by ministers, lawyers and doctors and all classes and conditions of men and women in public places, and why they are being recognized everywhere as the very best of high-class reading.—Maine Farmer.

The N. S. A. C. Animal Husbandmen.

Mr. E. S. Archibald, who for the past few years has held the position of Professor of Animal Husbandry and Farm Superintendent at the Agricultural College, Truro, Nova Scotia, leaves during the first week of July to assume his new duties of Dominion Animal Husbandman, with head quarters at Ottawa. He is being succeeded at Truro by Mr. L. S. Stevenson, B. S. A., a graduate of the Ontario Agricultural College in 1912. Mr. Stevenson is a son of Mr. R. S. Stevenson, of Ancaster, well known to many of our readers as one of the foremost breeders of Holstein cattle in Ontario. For fifteen (15) years prior to entering the Agricultural College at Guelph Mr. Stevenson Jr., was in practical management of his father's farm at Ancaster and has, therefore, in addition to his scholastic training, a splendid practical equipment in farm management.

The Agricultural College at Truro seems to be particularly fortunate in the men who have held the position of Animal Husbandry. The very fact that Mr Archibald was chosen for his new position is a sufficient indication of the success he has made of his position at Truro and we have every reason to expect that Mr Stevenson will be able to keep up the splendid traditions of the position which he has now assumed.

The Best Judge of a Thresher Is the Man Who Has Used It

It is not the purpose of this advertisement to tell in detail the merits of the Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Any reader who is thinking of purchasing a Thresher, will get our descriptive catalogue on application.

Four Horse Thresher.

Description of Four Horse Size

Dimensions of Cylinder - -	17x30
Size of cylinder shaft,	1 1-2 inch
Speed of Cylinder,	900 to 1000 Rev.
Size of Sieve - - -	31x36
Weight not mounted,	1700 lbs.
Weight with wheels etc.,	2200 lbs.

Woodstock, Dec. 12th, 1911.

THE SUSSEX MANUFACTURING CO.
Sussex, N. B.

Dear Sirs:—I can say in regard to your Four Horse Threshing Machines, that I have used many makes of machines, but will say that the Sussex Little Giant is the best I ever used, it runs easy and cleans good and without any waste of grain.

Yours truly,
F. D. BURPEE.

This is just one of hundreds of similar testimonials we have.

We make the Little Giant Thresher in four different sizes: one horse, two horse, four horse and ten horse power.

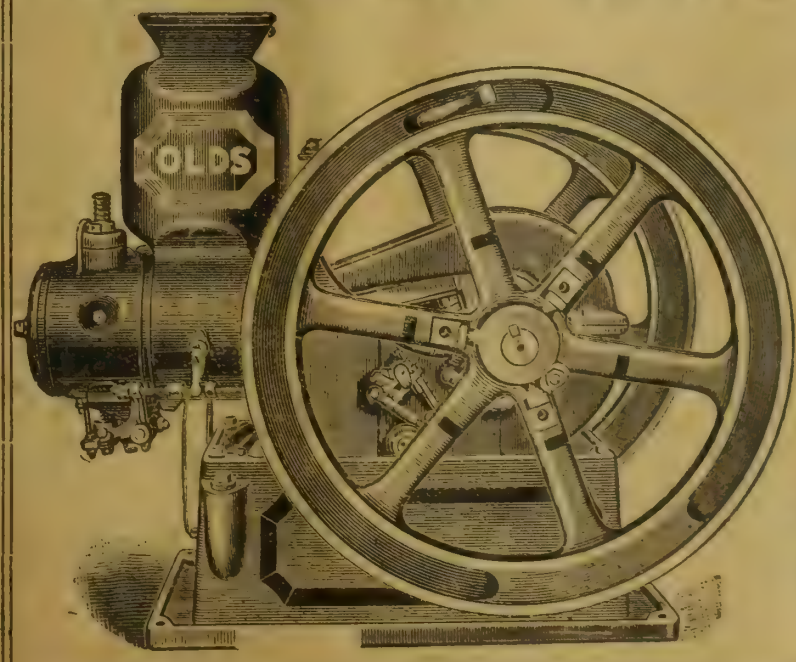
Threshers can be supplied with or without tailings elevator and bagger. Every machine is guaranteed for one year against all defects in workmanship and material. We carry a large stock of Thresher Teeth and other repairs.

All enquiries will receive prompt attention.

THE SUSSEX MANUFACTURING COMPANY, LTD.

SUSSEX, - - New Brunswick.

IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole Sale Representatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

LOGAN BROTHERS,
Amherst, R. R. No. 1, N. S.

THE ADVERTISING PAGES of the Maritime Farmer will help you to get the most value for you money.

What the St. John's Newfoundland Agricultural Society is Doing.

A good attendance of farmers greeted the Executive of the Society at the quarterly meeting held recently in the British Hall at 11 a.m., when the quarterly reports of the various Committees—on Live Stock, Machinery, Lime, Milk, Feeds, Fertilizers, Seeds, Literature, etc., were read by the Secretary.

LIVE STOCK.

Fourteen more sheep have been distributed in St. John's East, but only three more in St. John's West owing to the small number of applications received from this district and the difficulty of getttng dogs and sheep to agree together. In St. John's East the majority of the people have signed the petition sent out for the encouragement of Sheep Raising. An effort has been made to encourage the Raising of Ponies. The Board of Agriculture has promised to supply more Agricultural Live Stock including twelve more sheep during the coming quarter, in addition to those to be provided by the Society.

MACHINERY.

More labour saving machinery, such as Potato Diggers and Cultivators, and another Threshing machine or two, will be needed, because the Reapers, Binders, Distributors and Threshers already supplied have given great satisfaction and encouragement. More oats have been grown and threshed during the past season than ever before and greater preparations made for further advancement in this direction.

SEED OATS AND THRESHING.

Five hundred bushels of White Scotch Banner Seed Oats due from Glasgow by the "Mongolian" next week will be supplied to members at cost for ripening and threshing.

FERTILIZERS.

Forty tons of Nitrate of Soda (ten tons more than last year), and the usual quantity of Superphosphate, Dissolved Bone, Sulphate of Potash, Raw Bone Meal and Basic Slag will also arrive by the same steamer. No Sulphate of Ammonia has been imported this year as Mr. Rennie of the Gas Company has informed the Secretary that his Company are manufacturing Sulphate of Ammonia here in the city and would be prepared to take orders for it, and deliver same some time in May. Several members who bought some of Mr. Clouston's fish fertilizer last year found it of good value. The same was said of the fertilizers supplied by Mr. Colin Campbell. The Society is disposed to favour the manufacture of local fertilizers; and there is so much lime stone phosphate rocks silica, magnesia, manganese, potash, etc., the industry should prove a profitable one. Mr. Howley, the Geographical Surveyor, has given good report of these.

LITERATURE.

Over five hundred reports and magazines received from various Agricultural Departments and Boards, including those of our own Board of Agriculture, were distributed to those interested with the hope that those receiving them would speak on the different subjects mentioned, and disseminate some of the valuable information contained in them at the next quarterly meeting. Several members subscribed to the "Maritime Farmer."

The Society also decided to purchase and send out books of instruction on the management of sheep etc., for the use of their Live Stock Keepers.

DISTRIBUTION NOTICE.

It was noted that the Fertilizers and Seeds, including two hundred barrels of "Green Mountain" Potatoes "Irish Cobblers," "Dakota Reds," "New Early Rose," etc., would be delivered at Mr. George Neal's where members should leave their orders for these and the fertilizers; while the orders for small seeds should be left at the office of the Agricultural Board. All the Canadian Field Peas ("white marrow fat,") Timothy Hayseed, Red Clover and Six Rowed Barley, just imported by the Society, have already been engaged. Members would do well to get their orders in to Mr. Neal and the Board during the coming week.

In consequence of the large demand on the continent of Europe for Nitrate of Soda this year, the price has advanced considerably, though the society was fortunate in purchasing early, anticipating this increase.

A suitable quantity of Buckwheat, Barley, Alfalfa and Hayseed, for distribution to members has been received at the office of the Agricultural Board and the Society has twelve bushels of Buckwheat to distribute in May, for the purpose of experimenting in this valuable crop before recommending it generally.

POULTRY AND MILK RULES.

The question of Poultry has been left entirely in the hands of the Poultry Association; and the question of Milk Rules to the Board of Health, the committee appointed on this subject having an assurance from the Government that no laws will be passed making it compulsory on the society to submit to any rules without consultation with the Society and their hearty co-operation.

LIME.

Last, but not least, the question of Lime was considered. The report showed that a committee of the Executive had waited upon the Board of Agriculture on the matter and requested fifteen hundred dollars for the establishment of a Lime-Klin for the Society, and had secured for the farmers, entirely free, a deposit of lime stone, through the efforts of the Executive. The Board had promised to do their best in the matter of a lime-klin and already had under consideraiion the securing of lime at a greatly reduced rate, in the meantime, from the new Lime-Kiln of the D. I. & S. Co., at Port-au-Port.

ABLE SPEECHES.

Mr. S. Bowcock, who had just returnfrom England was asked to address the meeting, which he did briefly and well, and he advised the procuring of some ground limestone, a half ton of whch, he claimed, was as good as two tons of burnt lime, and he presented specimens of it to the executive. He also referred to the fact that the Agricultural Board of England refused to recommend the Tuberculin test for live stock as it was not considered sufficiently reliable.

Mr. Bowcock was heartily welcomed to his post of Honorary President.

Able speeches were also made by Mr. S. Ruby, Mr. P. J. Merner, Mr. H. R. Cook, Mr. E. J. Snow, Mr. Rush and other members, also by the Premier and Mr. Kent, M.H.A.

President Cowan replied thanking the Premier, Mr. Kent, and the members, for their interest in the work, and expressed a wish that more would attend the meetings of the society and help to advance agriculture in this country.

Seldom See

a big knee like this, but your horse may have a bunch or bruise on his Ankle, Hock, Stifle, Knee or Throat.

BELLEVUE STOCK FARM.

Bellevue won male and female championships and all the herd prizes in Shorthorns at the 1910 fairs. The championship for Ayrshire bull has been held by us for three years with our Morton Main's Gerthrope, an Osborne bred bull. All our prize winners, with the exception of our herd bulls were bred by ourselves. Write for prices or call and see us. We breed our winners and sell them too.

C. A. ARCHIBALD, Proprietor, TRURO, N. S.

Better Sheep and More of Them

Is the cry throughout the Maritime Provinces to-day. We are told by men who know that no where on the continent is there a country better adapted to the raising of sheep. Let me start you Mr. Farmer in this industry which is on the boom. Can supply you with some beauties. Write your wants. Correspondence solicited. **SUNNY BRAE SHEEP RANCH, Jas. A. Telfer, Sussex, N.B.**

COBEQUID FARM HOLSTEINS

We offer for quick sale, several bulls fit for service from cows with Record of performance tests of 12,715,75 lbs. of milk testing about 3.7 p.c. at 2 years 2 months, another with 13,283.5 lbs. milk and 512.67 lbs. butter when 2 years old and another with 18,482.75 lbs. milk and 753.3 lbs. butter in 1 year at maturity. These bulls are in good condition, well grown and straight. For particulars write.

SAMUEL DICKIE, - Central Onslow, Col. Co., N. S.

MAPLE FOREST YORKSHIRES

Litters Dating from February 15th and After.

ADDRESS

S. J. GOODLIFFE, - Sussex, N. B.

SUNNY SIDE STOCK FARM

Ayrshire herd founded 1889 now headed by "Greenslack Great Fortune" (Imported) A number of 1911 and 1912 bull calves for sale, females any age. One Guernsey bull calf.

In Chester White Swine I am booking orders for young pigs.

J. F. ROACH, 'Phone 111 **SUSSEX, N. B.**

Lawndale Stock Farm

offers for sale the following pure bred Shorthorn Stock.

Our herd bull "Prince Mistletoe," color roan, aged 3 years good size and in good condition, bredby N. S. Agricultural College. Also three of his sons, viz:—1 roan bull, 14 mos. old, out of a good milking cow and 2 bull calves, 5 mos. old; color roan. Prices very reasonable, write or call.

This is the make of instrument that is on the wall of nine out of every ten telephone users in Canada.

THIS PLANT IN MONTREAL STANDS BACK OF EVERY NORTHERN RURAL 'PHONE

THIS is the immense Canadian factory where Northern Electric Rural Telephones are made—in fact, where ninety per cent. of the telephones used in Canada come from. Our big organization, with its branches extending straight across Canada, is ready to help you in every detail of the formation and construction of a rural telephone line in your own community. Not only will we help you with your company-organization, line-construction, instrument-installation, etc., but our men are ready to give you much personal help out of their own telephone experience. With the help we offer, you can easily interest your friends and neighbors and operate your own self-maintaining telephone system.

Send For Our Book FREE

"How to Build Rural Telephone Lines" is an illustrated, cloth-bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells you absolutely everything in detail. No other book in existence deals so thoroughly with the subject from your standpoint. While this book has been costly to produce and we really ought to charge for it, we will send it free to anyone who, by sending us the coupon, proves that he is really interested.

Send Us The Coupon Now

PAGE 'ACME' LAWN FENCE

This famous 'Page' Fence comes in rolls up to 200 ft. in length. These are painted either white or green, and you may have "Page Acme" Fence in any height from 2 ft. to 6 ft. tall.

Be sure and get the genuine "Page Acme" Fence, for there are imitations on the market that resemble this fence closely. By getting the genuine "Page Acme" Fence you obtain high-carbon steel wire uprights, which are as stiff as thick iron rods.

This "Page Acme" Fence makes a beautiful fence for lawns, cemeteries, semi-public institutions, parks, etc. It is remarkably low in cost. When you consider the long life it has from being painted at the very beginning of its service, before you even set it up, you will see how economical it is to use this "Acme" Fence.

We have sold hundreds of miles, especially of the 42-inch width, and you will find this "Page Acme" Fence doing service all over the country. Write us today for the Page Catalogue of "Acme" Fences. If you need fence of any kind, remember the Page Catalogue shows it to you at Factory Price—scores of fences of the best quality.

Send Today for the Page Catalogue

This catalogue shows all kinds of Lawn and Farm Fences, fence material, iron fence—everything you possibly can need in this line at moderate prices. Write us today for the Page Catalogue.

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

THE Keeley Cure

For Liquor and Drug Using

WHY WE SUCCEED

Because of the true merit of our remedy, of the honesty of our statements and of the half million cured men and women, who can, do, and ever testify to the positive cures made by this treatment. Over thirty years constant use of the Keeley remedies demonstrated not only that Alcoholism, Morphinism, Cocainism, in fact all narcotic drug using, is a disease ; but through Dr. Keeley's system of treatment absolute, positive cures are made.

Time, which tries all things, has proven that the Keeley Cure does cure. Have you not a relative, friend or neighbor who is wasting his health, substance, and happiness of self and family with either drugs or liquor. **HE CAN BE CURED.** We can restore him to health, to earning capacity, to care of his family, to respect of his friends and business world. Our relations with our patients are strictly confidential ; there is no publicity in attending this Institute. There are no unpleasant restrictions, no contact with the low, immoral or debased. Those that come to us are the representative men and women of the community who, realizing that the liquor or drug is fastening itself upon them, determine to quit, and in place of doubtful experimentation at home come here for assistance.

The methods and treatment are without shock, inconvenience or harmful tendencies, and the patient passes from the addiction to a cure so easily and comfortably that he hardly realizes that he is the subject of medical treatment.

The treatment removes all craving or desire for liquor or drugs, restores the nervous system to a normal condition, clears the brain, and makes a man out of a nervous wreck.

Patients are not confined ; there is no irritating or vexatious restraint.

There is no Nausea or other Sickness attendant upon or caused by our treatment. Improvement begins at once and continues throughout entire course of treatment.

We have special accomodation for ladies, where they can be entirely exclusive, and can be treated as privately as in their homes.

Printed matter and particulars by mail in sealed plain envelope.
All letters promptly answered and treated as strictly confidential.

DE LAVAL
CREAM SEPARATORS

SAVE MUCH TIME AND LABOR
IN SUMMER

Besides their great increase in quantity and improvement in quality of cream and butter DE LAVAL cream separators save a great deal of time and labor.

This great saving of time and labor counts for more in summer than at any other season an often alone saves the cost of a separator, aside from all its other advantages.

As compared with any kind of gravity setting the saving of man's time and labor and usually woman's drudgery is simply overwhelming.

As compared with other separators the DE LAVAL saves much time and labor by its greater capacity, easier running, easier handling, easier cleaning and freedom from need of adjustment or repair.

These are merely some of the advantages which make a DE LAVAL cream separator the best of all summer farm investments, as every DE LAVAL agent will be glad to explain and demonstrate to anyone at all interested.

See the nearest DE LAVAL agent **at once** or if you do not know him write us direct for any desired information.

Gombating Early and Late Potato Vine Blights.

Spraying an Insurance Against Crop Reducing Fungi and Insect Pests.

IN our last issue we discussed the question of poisoning the Potato Beetle. Reports from various sections of the Maritime Provinces state that potato beetles are quite prevalent this season and in order to save the crop from their ravages it is very necessary that the instructions given in our last issue be closely followed. A great many of our readers have followed a systematic system of spraying for years and to these we would say: follow whatever system you have found, by practical experience, to give you the best results. On the other hand there are many farmers who have never sprayed. Some of them are spraying this year and are undoubtedly more or less guided by what they read of the experiences of other growers.

In this article we deal with spraying as an insurance against early and late blights.

Potato blight is the dying of the leaves and vines before the crop is mature, and as the leaves of the plant constitute the plant's stomach, as referred to in our last issue, as soon as the tops die the tubers cease to grow and there is a tendency for rot spores to begin their ravages on the immature tubers.

Experience has shown that proper attention to spraying is one of the most important factors in successful potato culture. Spraying is, in reality, a form of insurance, and should be so regarded by the grower. There are seasons in which the financial returns from the practice are not large, but in some seasons thorough spraying at the proper time may, and usually does, insure a full and profitable crop where otherwise only failure would result. One writer records on one farm an average gain of over 41 barrels per acre from spraying during 16 consecutive years. Another reports an average net profit of $22.79 per acre during three years on several different farms growing together from 60 to 180 acres. Experiment Stations have repeatedly secured equally good results in tests under average farm conditions.

Vinegar Factory, Bridgetown, N. S.

A Bank of Apples for the Vinegar Mill.

At present our spraying is entirely directed towards the control of the early and late blight and certain insects which feed upon the porato. It is important that the grower should learn to recognize and distinguish these diseases from each other.

Early blight (sometimes improperly called rust) is more common on light, dry soil and in dry seasons. It may appear on the plant at any time after it is about six inches high, and is more likely to attack it at, or about blossoming time. It is a weakling parasite and any condition which places an extra strain upon the growing plant predisposes it to the attacks of the fungus. It appears first as small, dark brown spots scattered over the older leaves. These slowly enlarge and become somewhat angular in shape on account of the fact that they stop on reaching a leaf vein. There is usually a sharp boundary line between the healthy green of the leaf and the spot, although a badly spotted leaf will have a decidedly yellow appearance over the entire surface. Close examination of early blight spots will usually show concentric lines or "target board" markings. Early blight seldom, in any one year, produces so much damage as does the late blight. It is slow but sure and one year with another does a large amonnt of injury to the crop by killing off the foliage before the tubers are mature. Early blight is not known to cause rot of the tubers.

Late blight frequently, appears suddenly and works with lightning rapidity. A field which is apparently healthy today may have nothing remaining but the bare stalks in a week's time. This disease not only kills the foliage but is also responsible for most of the rot of the tubers. Contrasted with early blight it is more of a leaf blotch than a spot disease. The diseased areas are of a lighter brown, there is a gradual fading off from the healthy to the lighter green around the diseased areas. The affected portions are larger and increase in size much more rapidly. No concentric rings are to be seen. The underside of the leaf presents a very characteristic appearance, for the margin of each diseased area has a faint, powdery white appearance due to the formation of the spores of the fungus. This is especially true on the more shaded leaves, or in the early morning or on a cloudy day. Warm, moist, "muggy" weather with frequent showers produces ideal conditions for the development of the leaf blight.

Arsenical or paris green poisoning, sometimes mistaken for blight, produces spots somewhat like those of the early blight, but they are not so sharply marked on the under side and are of

a lighter color, more like those of the late blight. These spots are almost invariably associated with flea-beetle punctures. They are caused by improper use of paris green and may be prevented by applying paris green with Bordeaux mixture or by the addition of two or three pounds of lime (not air slaked) to a barrel of the poison solution.

Spraying apparatus.—There are various types of sprayers but those which appear to find the greatest favor with our growers are the automatic type. These are provided with a pump run by a sprocket chain from the wheel of the cart, and spray from four to six rows at a time. The perfect spraying apparatus has not yet made its appearance. The best that we have today leaves considerable to be desired with regard to adjustment. The manufacturer should send a first-class mechanic into the potato field to study the needs of the grower and then alter his machine to meet them.

The first essential for the effective sprayer is a pump sufficiently powerful to develop a pressure of 60 or more pounds to the square inch and to furnish a constant supply for from four to six double nozzles. The nozzles should be of a type which gives a fine spray or mist which covers all of the leaves evenly with a thin film. Otherwise the material deposited in drops, will tend to run together and fall off. The nozzles should not be attached to a solid iron pipe but should should be so arranged as to admit of considerable vertical and lateral adjustment, being connected with the pump by flexible tubing.

Every machine should be equipped with double nozzles for each row (single nozzles may be used on small plants) and the vertical adjustment should be such that by rising the nozzles sufficiently the bases of the spray cones would cover the entire row. Much of the loss on sprayed fields can be charged to the lack of this adjustment and the use of single nozzles. Field after field was sprayed with this type of a machine and only about one-third of the foliage was protected. Such spraying is worse than useless, for it tends to discredit an efficient remedy.

There should be some provision for keeping the mixture constantly agitated. The working parts of the pump should be of brass and the intake should have a brass strainer. Some of the best machines have a brush attached to the agitator which moves back and forth over the strainer of the intake, keeping it constantly clean.

Bordeaux mixture.—Standard Bordeaux mixture consists of 5 pounds copper sulphate, 5 pounds of lime and 50 gallons of water

The copper sulphate should be dissolved and the lime slaked in separate vessels. The most satisfactory and effective Bordeaux is made by diluting each solution with half of the water to be used and then quickly uniting and mixing the cold, dilute solutions together. Where running water is available an excellent plan is to build an elevated platform, each with a rubber hose attached to the bottom with the open ends suspended above the tops of the barrels. By quickly lowering and placing the free ends of the hose together in the top of the spray tank it is rapidly and easily filled and the solutions are properly mixed at the same time. Where water is taken from a stream the platform can also be used by placing a cheap iron pump on a framework just above the tops of the barrels and having a connecting pipe running down into the stream.

It is more convenient to prepare stock solutions of copper sulphate and lime. For this use two 50-gallon oil barrels. Fill one with water, place 50 pounds of copper sulphate in a clean sack and suspend near the top. The sulphate will then dissolve in a short time. Only wooden or earthen vessels should be used for copper sulphate. In the other barrel place 50 pounds of fresh stone lime, slake as in making whitewash and then dilute in 50 gallons. Each gallon of stock solution will now contain one pound of material. For each tank of mixture stir the stock solutions thoroughly and then dip out five gallons each (equivalent to five pounds of solid material) and make up to fifty gallons as already described.

Do not substitute guess work for weights and measures and do not vary the proportions. If you wish to do more thorough work increase the amount of mixture applied per acre but do not use over 5 or 6 pounds of copper sulphate to 50 gallons of mixture.

To avoid clogging the nozzles it is necessary to strain either the milk of lime solution or the resulting mixture. For this use a brass wire strainer of about 30 meshes to the inch (No. 50). This strainer will work much better if the wire bottom is so arranged as to stand at a considerable angle instead of parallel with the top. In this way the solid particles are washed to one side and clogging is avoided.

When and how to spray.—It should be remembered that spraying is a preventative and not a cure. The object is to kill the spores of the fungus before they have time to germinate and enter the leaf tissue. The writer has seen a number of failures with spraying this season where enough Bordeaux was used but it was not used at the right time. Such spraying is about as effective as applying a fire hose to the outside of a house where the fire is located in the interior partitions.

It is best to begin spraying when the plants are six or eight inches high and repeat every ten days or two weeks, making six applications. The potato growers should observe what weather conditions favor or retard blight and act accordingly. In very wet weather like the present season spraying once a week may be necessary. Do not stop for rainy weather. This is just the time that spraying is most needed. If the mixture has sufficient time to once dry on the leaves it does not wash off very readily. If it does wash off, apply some more, for one spraying at this time may be more effective than several sprayings later. Do not apply a certain number of gallons per acre and feel that your responsibility ends there. Make sure that every leaf is reached and protected by the mixture at each spraying. If your machine does not do this, remodel it till it does, whether it requires 50, 100 or 150 gallons per acre at each application.

Insects.—While the intention of this article is to discuss spraying for fungous diseases, insects are so intimately associated with the question at hand that they cannot be entirely overlooked. By wounding the leaf tissue they increase the avenues for entrance of fungi and lower the vitality and resistance of the plant. They doubtless have much to do with the transference of the spores of fungi from leaf to leaf and from plant to plant. In addition to the Colorada beetle, small flea-beetles often riddle the leaves and make them resemble the cover of a pepper-box. Certain green plant-lice frequently cause much damage by sucking out the plant juices, and grasshoppers may, at times, do considerable injury to the leaves and stems, especially near the edges of the fields. Bordeaux mixture thoroughly applied, is an effective repellent for the chewing insects, especially the flea-beetles and the mature beetles which are not so readily combatted with paris green as are the young "bugs" of the latter species. Paris green should always be added to Bordeaux mixture as long as there is any danger from insects, using from one to two pounds per acre. There is no danger of burning the foliage if the paris green is applied in this way. A good method is to thoroughly mix the proper amount of paris green with the thick lime whitewash and allow it to stand for a time before diluting to make the milk of lime solution. In this way all the free acid which causes the burning is neutralized and the trouble of adding paris green to each tank of mixture is obviated. Some growers claim that to do effective work a little more paris green is required if used with Bordeaux mixture than without.

FIVE YEARS OF POTATO SPRAYING IN NEW YORK STATE.

From a New York State Bulletin we glean the following accounts of spraying tests:

For five consecutive years of testing, potato spraying has proven, each year, a useful and profitable practice. The past season, that of 1906, was in most parts of the State the least favorable of any of the five for the development of the principal potato disease, late blight and rot; yet in nearly all of the eighty tests reported spraying gave good returns for the money expended and labor applied.

Early blight was somewhat more destructive than usual and a few fields suffered quite severely from this disease; but this trouble rarely causes such havoc as is often wrought by late blight and the rot that follows it. Against early blight, however, spraying is not considered a specific, as it is against late blight; but in fields where this blight prevailed and where sprayed and unsprayed rows both showed signs of infection, its severity was decreased by spraying; so that digging time showed distinct gains from the application of bordeaux mixture.

Another unknown trouble was also a cause of injury in several localities. While the cause of this brown, curled appearance of the leaf margin was not determined, it much resembles tip-burn. Though probably a physiological trouble due to the hot dry weather in August, it was to some extent controlled by spraying since treated rows showed less signs of injury from this cause than those unsprayed.

Flea beetles were present in many of the fields; and these were quite well controlled by the bordeaux and poison. In one or two instances a larger flea beetle threatened damage but was held in check by the spraying.

Late blight began its attack early, —in late June on Long Island and about the middle of July up the State. It seemed liable to be very destructive; but a period of hot, dry weather in August checked its inroads; so that, as already stated, the damage from this blight was less than at any time during the five years of the tests. Consequent upon this checking of the blight there appeared to be a greatly lessened power to produce rot, for very little of this trouble appeared, even where the later weather conditions were favorable. There were very few rotten potatoes anywhere in the State.

Though the season as a whole was, therefore, a poor one for showing the advantage of spraying in its strongest point, protection against late blight, it did bring out the advisability of spraying to control other troubles; for two only out of eighty tests failed to show increased yields and only four or five failed to show financial profit.

STATION TEN-YEAR TESTS.

The ten-year tests were continued by the Station, as in 1902, 1903, 1904 and 1905, in two localities, Geneva and Riverhead. The same plan was followed, of single-row treatments (not sprayed, sprayed three times and sprayed every two weeks) repeated in series throughout the plat so that the area devoted to each method of treatment was one-tenth of an acre. The spraying was done with a knapsack sprayer, very thoroughly. 'Bugs" (Colorada potato beetles) were kept in check by the use of poison with bordeaux mixture on sprayed rows and by poison in lime water on "unsprayed" rows.

The yields were fair at both Geneva and Riverhead but, for reasons already given, only moderate gains were secured from the spraying. At Geneva, the "unsprayed" rows (sprayed with poison, only, to protect from "bugs") yielded at the rate of 195 2-3 bu. of marketable potatoes per acre; those sprayed with bordeaux mixture three times during the season, at the rate of 227½ bu.; and those sprayed five times, at the rate of 258 2-3 bu. That is, three sprayings with bordeaux mixture gave a gain of 32 bu. per acre and five sprayings a gain of 63 bu. The two additional sprayings, which practically doubled the gain, were equivalent to one double spraying, since the bordeaux applied August 20 was washed off by a heavy rain before it dried and a second application was made the next day.

At Riverhead the unsprayed rows yielded at the rate of 150⅔ bu. per acre, those sprayed three times 172 bu., and those sprayed five times 203⅔ bu. It will be noticed here also, that the two additional sprayings were of decided advantage, since three sprayings gave a gain of only 21⅓bu., while five sprayings more than doubled this gain,—53⅓bu. per acre: There was no rot either at Geneva or Riverhead.

The following table shows the results obtained in the ten-year experiments during the first five years:

TABLE I.—SUMMARY OF THE TEN-YEAR EXPERIMENTS FOR FIVE YEARS.

	At Geneva.		At Riverhead.	
YEAR	Gain per A. due to spraying every two weeks.	Gain per A. due to spraying three times.	Gain per A. due to spraying every two weeks.	Gain per A. due to spraying three times.
	Bu.	Bu.	Bu.	Bu.
1902	123½	28½	45	27⅔
1903	118	88	56	39½
1904	223	191	96	56½
1905	119	107	82	31½
1906	63	32	53	21½
Average	123	103½	66⅓	35⅓

FARMERS' BUSINESS EXPERIMENTS.

The farmers' business experiments carried out in 1903, 1904 and 1905 and reported in Bulletins Nos. 241, 264 279 proved very helpful. The good results secured in most of these tests proved, not only to the neighbors of those making the tests, but to hundreds of others who read the reports, that potato-spraying is simple, not requiring the services of an expert but well within the ability of the average farmer, is effective and is likely to be profitable.

It was thought best, therefore, for the Station to arrange for similar tests in 1906. Fifteen growers who were intending to spray co-operated

with the Statian in such work, and carried out the tests. The growers furnished apparatus and materials and did the work as best suited their own plans. Each experimenter was required to leave a few rows unsprayed in a representative portion of the field. The Station merely gave advice when asked to do so and supervised the harvesting sufficiently to obtain an accurate measure of the effect of the spraying. A row or more in the unsprayed strip was compared with a similar row or rows in the sprayed section. Usually the yield of the center one of the three unsprayed rows was taken as the measure of the yield of unsprayed potatoes; and the average of two sprayed rows (the second sprayed row on each side) as the measure of the yield of sprayed potatoes.

The profit in each case, in this table and the next one, is based upon the actual market price of potatoes at digging time in the nearest or customary market of the grower.

As will be seen from the table, these tests were all on a large scale, 5 acres being the smallest area sprayed. The fact that there was an increase in yield from spraying in each experiment shows clearly the widespread occurance of potato troubles preventable by spraying; but the smaller average gain, 42½ bushels per acre, and the increased cost of spraying both tend to lessen the profit. Yet in every case there was some gain.

NEW REASON FOR SPRAYING.

The eating qualities of spraying, their flavor and meanliness, are largely due to the amount of the starch present in the potatoes. The more starch the potato contains, the better seem to be all its qualities, keeping as well as edible. The Maine station has shown as the result of many experiments, that potato plants sprayed to prevent being weakened by bugs and blight are considerably richer in starch than the unsprayed. Even more striking results were obtained in Norway. Potatoes of ordinarily good quality contain 12 to 20 per cent. of pure starch. "Starch accumulates most rapidly when the plant is maturing. Theoretically, anything which prolongs the growing season ought to increase the amount of starch which will be stired up in the potato; hence, if vines sprayed. . . live longer than those not treated, not only should the yield of potatoes be larger, but the percentage of starch should be higher."

As the Maine station says, if the increased quantity of starch "found in the sprayed over unsprayed potatoes was due to the treatment of the vines (and no other explanation suggests itself), this alone is a strong argument in favor of spraying."

NORTH WALES EXPERIMENTS.

As a result of four years' experiments carried out by University College of North Wales, Bangor (Agricultural Department), the following directions for spraying potatoes have been drawn up:—A dressing sufficient for 1 acre is 24 lb. sulphate of copper (98 per cent pure), 30 lb. pure washing soda, 120 gallons of water. Washing soda is recommended in preference to lime. To meet the difficulty of dissolving the above quantity at one operation, the mixture should be prepared in a wooden vessel which will hold 25 gallons of water. First wash out this vessel thoroughly, and pour into it 15 gallons of clean water;(then take 4 lb. of sulphate of copper broken to a fine powder; place it in a canvas bag, and stir it about in the water until the sulphate of copper is all dissolved. Next dissolve 5 lb. of washing soda in 5 gallons of water in a separate tub; then pour the washing soda solution into the sulphate of copper solution and stir well. The mixture should then be tested with blue litmus paper; If the litmus is turned red more washing soda should be dissolved and steadily added until fresh litmus paper put into the solution remains blue. The quantity of material thus prepared is sufficient for one-sixth of an acre. As the nozzles of spraying machines are easily choked, the mixture should be poured into the machine thtough a canvas cloth. Spraying should be done about the end of June or beginning of July, and again in about three weeks.

Plots sprayed with the above mixture showed in all cases a marked increase in the quantity in marketable potatoes raised, as will be seen from the annexed table:—

YEAR	CENTRES	Average weight of marketable potatoes.											
		Unsprayed			Sprayed once (early)			Sprayed twice			Sprayed once (late)		
		T.	C.	LB.	T.	C.	LB.	T.	C.	LB.	T.	C.	LB.

1911	11	12	2	88	12	14	89	13	7	16	13	7	97

DIRECTIONS FOR SPRAYING.

In general, commence spraying when the plants are six to eight inches high and repeat the treatment at intervals of 10 to 14 days in order to keep the plants well covered with bordeaux throughout the season. During epidemics of blight it may be necessary to spray as often as once a week. Usually six applications will be required. The bordeaux should contain four pounds of copper sulphate to each 50 gallons in the first two sprayings and six pounds to 50 gallons in subsequent sprayings. Whenever bugs or flea beetles are plentiful add one to two pounds of paris green or two quarts of arsenite of soda stock solution to the quantity of bordeaux required to spray an acre.

Thoroughness of application is to be desired at all times, but is especially important when flea beetles are numerous or the weather favorable to blight. Using the same quantity of bordeaux, frequent light applications are likely to be more effective than heavier applications made at long intervals; e. g., when a horse sprayer carrying but one nozzle per row is used, it is better to go over the plants once a week than to make a double spraying once in two weeks. A good plan is to use one nozzle per row in the early sprayings and two nozzles per row in the later ones.

Those who wish to get along with three sprayings should postpone the first one until there is danger of injury from bugs or flea beetles and then spray thoroughly with bordeaux and poison. The other two sprayings should likewise be thorough and applied at such times as to keep the foliage protected as much as possible during the remainder of the season. Very satisfactory results may be obtained from three thorough sprayings.

A single spraying is better than none and will usually be profitable, but more are better. Spraying may prove highly profitable even though the blight is only partially prevented. It is unsafe to postpone spraying until blight appears. Except, perhaps, on small areas, it does not pay to apply poison alone for bugs. When it is necessary to fight insects use bordeaux mixture and poison together.

TABLE II.—SHOWING RESULTS OF BUSINESS EXPERIMENTS IN 1906.

EXPERIMENT.	Area sprayed	Number of times sprayed	Increase in yield per acre	Total cost of spraying per acre	Cost per acre for each spraying	Net profit per acre
	A.		Bu.			
Chafee	10.4	5	49.8	$4 70	$0 94	$15 23

Total area sprayed in fifteen experiments, 225.6 acres.
Average increase in yield per acre, 42.6 bushels.
Average total cost of spraying per acre, $5.18.
Average cost per acre for each spraying, 98.5 cents.
Average net profit per acre, $13.89.

The following table shows the results of the farmers' business experiments for four years, 1903 to 1906 inclusive.

TABLE III.—SHOWING RESULTS OF BUSINESS EXPERIMENTS, 1903-1906.

YEAR.	Number of experiments.	Total area Sprayed	Average incaease in yield per acre.	Average total cost of spraying per acre.	Average cost per acre for each spraying.	Average net profit per acre.
		A.	Bu.			
1903		61.2	57	$4.98	$1.07	$23.47
1904	14	180	62.2	4.98	.93	24.86
1905	13	160.7	46.5	4.25	.98	20.04
1906	15	225.6	42.6	5.18	.985	13.89

Average net profit for four years, $20.51 per acre.

Supplement the Pasture.

There is no better ration for milch cows than pasture grass in sufficient quantities; but during the late summer and fall, before the cattle are housed for the winter, it is apt to fall short of furnishing the needed amount of nutrition for maximum results; especially if it happens to be a dry season. Pasture grass is nearly a balanced ration of itself when grown under favorable conditions and it is a waste of money to supplement it with other feeds; but during the latter part of the summer and fall, I believe it has a far different composition from what it has during the spring and early summer.

As the season progresses it naturally becomes more mature and then I believe the composition also changes, due to the more unfavorable conditions. Favorable growing conditions certainly improve the composition, at least as far as the feeding value is concerned. The same variety of potatoes or any crop may be planted on different soils yet one be of excellent quality while the other is not fit to eat. Then it is a well known fact that feeds greatly influence the quality of beef and pork. On some feeds the beef will be of the very best quality, while on other feeds the same meat would be tough and of a far different quality. It is somewhat the same with pasture grass. During the spring and early summer the favorable growing conditions produce it in a tenderness, palatability and amount of nourishment that the same grass does not possess in the late summer.

Then at this time cattle seldom eat sufficient quantities of it to constitute a well-balanced ration. Often it is short and dry and they will eat only enough to satisfy their hunger. As a necessary result, the milk flow falls off nearly one-half. It is no simple matter to maintain a normal milk yield during this period and the cause, I believe, is largely due to the food supply and of the cattle not eating enough to supply the needs of normal milk production.

If one can maintain the milk flow by supplementing the pasture, and the extra milk produced leaves a profit over the cost of the added expense, it is a wise idea to add to the pasture ration. Green sweet or field corn helps wonderfully. The cows like it and will eat all they can hold of it, if it is given to them. There may be more profit in feeding part of it to them to help out the pasture when it is short than later in the winter. One must begin the feeding of it gradually and not overfeed at first, as an overfeed when they are not used to it may cause serious trouble.

One objection to the feeding of a green feed to supplement the pasture is that the cattle become inclined to depend too much on the green feed and graze but little in the pasture. While green pasture grass is a balanced ration, corn in the same stage is not, and needs a little grain ration to furnish the part of the ration in which it is deficient.

It is a mistake to let cows fall off in yield if it can be avoided, as it is hard to get them back again. When grass gets stunted in midsummer and then the change to dry feeding with grain soon comes, it has a tendency to keep the yield down, unless the animal has been prepared for the change by a liberal ration. Many careful feeders, who make a study of winter feeding and who know that pasture grass is a balanced ration are apt to abuse the knowledge, taking it for granted that it continues to be so throughout the season. For maximum profit, no one part of the milking period can be neglected, and when pasture needs a supplementary feed in the late summer and fall it should be furnished to the cows.—Lynford J. Haynes.

We are again in receipt of subscription fee sent in without the sender's name. In this case the postmark is not clear, and we have no idea from whom the two dollars ($2.00) has come. If any of our readers have sent in subscription, and received no acknowledgement of same, will they kindly notify The MARITIME FARMER Office, St. John, N. B. at once.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

BRAIN BETTER THAN MUSCLE.

Dynamite is one of the new discoveries for reducing labor on the farm. Instead of digging out stumps, as was once necessary, this hard work is easily and quickly done with dynamite. But this is not all; impervious subsoils are opened up, soils with whiterock near the surface are deepened and made suitable for growing larger crops. Instead of digging deep holes for fruit trees with the spade, where there are boulders, this may be done with dynamite.

The objection to farm life upon the ground that there is too much drudgery is disappearing. With improvements in labor-saving machinery, the use of better teams, automobiles, dynamite, stump pullers, gasoline engines, and dozens of other late inventions farm life has been elevated to a pleasant occupation where brains are more essential than muscle.

SUCCESSFUL EEFORT.

A good farmer has great influence in his community for better methods of farm management. His methods will be adopted, his plans followed and his views become common sentiment. Even those who denounce his methods as impractical and unworthy of consideration are moved to relent when it is seen that this man makes a success on his farm. Perhaps many of his plans are copied unconsciously, or at least slightly modified, so that the originator will not be credited with giving them. But this in no way reduces the value of the successful man's influence. His work bears fruit, not alone on his farm, but alike on the farms of his neighbors, for successful effort will convince the most obstinate.

TAKING UP FARMS.

The last issue of the Royal Gazette contains a list of thirty five applications for homesteads on crown lands in New Brunswick, showing that the forward movement includes an increase in the number of people turning their attention to agriculture.

CUT TIMOTHY HAY EARLY.

Cut timothy when the first bloom begins to fall if you want the most palatable forage. Where the greatest tonnage per acre is desired it may be permitted to remain a few days longer, The early cut timothy, however, is more palatable than that cut late. Horses will eat it up completely, and a larger proportion of it is utilized. There is nothing new to be told about cutting timothy hay except to call attention to the fact already noted. That is don't let it become too ripe. Ordinarily it is possible to start the mower early in the morning. By 2 o'clock on small fields it is possible to rake it up in windrows and have it in shocks by nightfall. Here let it remain for a day or two unless there is danger of damage from storms. Then it can be baled or stacked or put in the barn. Where large areas are harvested, the large loaders and hayforks are employed. In no other way can the crop be properly handled.

It must not be forgotten that timothy hay is not in good standing with the scientific agriculturists. This hay has been "knocked" for so many years that the man who wants to be known as an up-to-date farmer will scarcely admit he he has timothy on his place. It contains little protein, according to the experiment station men. It isn't a balanced ration. It is a poor yielder, and has committed many other sins; but in spite of this, timothy cut at the right time and cured in the proper manner is a mighty good horse feed, as anyone who has had large experience in horse raising is ready to testify.

THE HIRED MAN-

Help is easier to get on farms where conveniences are most plentiful. Men do not like to use awkward implements or do walking when it can be avoided. Farm hands like to work on farms are progressive. Wages are not all that the hired man cares for, He likes a good home as well as the rest of us and thrift, comfort, convenience and a peaceful family all are inducements to the man you want.

These things should all be carefully considered and brought to the highest state of perfection. It pays to take a permanent hand into partnership to some extent. He will then feel like a partner and not altogether a drudge. This scheme makes wages less and still the hand is better paid and better satisfied. The partnership need not be extensive but a small interest in stock, poultry or crops gives the hired man a big interest in everything.

SIR WILLIAM'S ADVICE.

Sir William Van Horne has joined the New Brunswick boosters' Club. At least that is inferred from the fact that Dr. L. P, Jacks of Oxford, England after looking over Canada for a suitable location for a large fruit farm, has come to New Brunswick having been recommended by Sir William to do so. Dr. Jacks has fixed upon a six hundred farm at Hampstead, Queens County as a desirable location, It is his intention to settle his five sons upon the farm. New Brunswick as a fruit growing province is attracting more and more attention. A. G. Turney, provincial horticulturist, set out recently to select sifes for the commercial orchards which are to be established under his direction by the Boards of Trade of St. John, Moncton and other towns in the province.

SUMMER CULTIVATION.

The theory of the dust mulch made by shallow cultivation is that as plants approach maturity they need a great quantity of water, and as at that particular time rainfall is generally deficient, it is necessary to conserve or save the water in the soil and evaporates unless the surface is broken by cultivation. As plant roots by this time are filling the upper few inches of the soil, it is necessary to cultivate as shallow as possible, so as not to injure the root system.

Keep the cultivator going so as to maintain a dust mulch, especially after a heavy rain that has packed the soil. Weeds of course, should be kept down, but cultivate whether fields are clean or not, if necessary to break a crust after a beating rain.

EDITORIAL NOTES.

Faults in a herd can be eliminated most quickly by careful breeding and selection.

A concrete tank will not spring a leak and at the same time it will always be ready for use.

The consumer is looking for the kind of eggs that he will not be affraid to eat with his eyes shut.

A showyard cow which is a great producer of milk and butter is the easiest animal in the world to sell. Why not breed for her.

Some people think that the dry cow needs no care but those that make the best records have the best care during their period of rest.

The farmer who can tell just what it costs to produce and market a crop is not so very common but when you do find such a man you find one who is a success.

How much is it worth to you, brother farmer to be your own boss? Did you ever set it down among your assets? Think about it, whenever you become a little discouraged over your prospects.

Your wife is entitled to a fair share of the labor-saving equipment. Her work is more important than yours because she maintains the home and trains the children for society. The success of the home depends on the way it is kept.

The boy's place on the farm should be bigger than merely following the plow, the harrow and the binder if he is to be kept on the farm. He should have a voice in the planning for the season's work and be allowed some blooded stock to raise for his own.

It is the young men who have gone through college and have returned to the farms who are changing conditions, They have the benefit of contact with business activity, together with the training to think quickly that promises well for the improvement of the farms.—Country Gentleman.

Every dollar spent in buying needed equipment for the farm is an investment that the farmer should be glad to make. It is the duty of every farmer to keep posted upon new implements and whenever one is found that saves labor and brings returns buy it for his farm. A man progressive enough to look for needed equipment seldom finds any difficulty in finding cash to buy it.

Wage an increasing war against flies. As a precautionary measure, keep the stables clean. This means that the stalls must be cleaned out often and some kind of disinfectant used. If you can not for any reason spread the manure over the land promptly, the pile should be screened to prevent flies from breeding in it. Keep the premises free from garbage accumulation and exercise caution in making hog pens sanitary.

Farm life is often spoken of as monotonous but is there any reason why it should be? The environment of farming is far more varied, more interesting and more attractive than city life. Those who must sit at a desk in a shower of dust and endure heat during summer and dreary weather in winter for from 8 to 12 hours a day may find life monotonous, not the farmer surrounded by nature in all her charm.

Keep Pace With Prosperity.

Editor the Maritime Farmer:

The rotation and variety of crops is a most important subject for discussion amongst farmers, and we continually hear of some new system being advocated.

In our Island Province a six or seven year rotation has, until the last few years, been followed by a large majority. This did not include very much roots and corn as there was only a limited quantity of manure being made. The foregoing system was an easy one to follow and did not require much labour in applying large quantities of manure or harvesting heavy producing crops. An independent farmer has often practiced such for years, and as it required little labour and expense he could have a comparatively easy life and often save considerable money.

Now, we are all agreed that a special line of live stock farming, that will yearly increase the producing and earning power of the farm, and give employment to a greater number of people must be better for the Country, and a better paying line for the farmer, rightly operated; but it is much more complicated, as more capital is invested and it certainly requires greater skill to operate successfully.

A fairly large farm, althohgh in a rather poor state of fertility, is often operated so as to earn more clear money for the owner than a smaller, more fertile and more intensely cultivated farm. The reason is this: the smaller farm, handling a variety of heavy producing crops, invariab,y has more machinery and and a much heavier expense in upkeep in proportion to its earning powers than has the large farm. It has always been my opinion since giving the subject much thought, that the farms of the future must grow larger instead of smaller. When we have once gathered together the machinery necessary to work a 100 acre farm, and the necessary farm buildings and fencing for same, we will find that we could work a 300 acre farm without the addition of any cost excepting labour.

It requires, and it pays us to buy a great variety of machines for our different kinds of work even if the same machines are only used a few days in the year. They are a great expense, but the manual labour they save is still more expensive, so we must make arrangements so these machines can do a greater service.

An account was published lately in one of our Canadian fari papers of a census conducted in Tompkins County in the U. S. to determine which system of farming was paying the operators the greatest clear amount for their work. Many comparisons were made and much valuable information secured, and in almost every instance the larger farm earned more than the smaller farm, even when the smaller one was better managed. So it would seem that the greatest profit can only be made where large farms are brought under one manager and by having the necessary help to work the farms. When handy to a good home market small farms can certainly be most profitably worked growing vegetables, fruit, poultry and other products. Vegetables are very costly to carry any distance, and only when the prices are high can they be carried far. But vegetable growing at present prices must be a splendid paying line of farming and it has always been a wonder to the Islander why Nova Scotia farmers who can secure much better prices do not grow sufficient to supply their own home markets.

With the price of almost every product grown or raised upon the farm steadiiy going up in value it is surprising to see such an indifference, such a lack of enterprise shown by so many farmers in not rising to meet the demand, and is preparing to enlarge their production, as a manufacturer would who found his business growing. How many men do we see year after year content to keep the old farm growing about the same yield of crops anh carrying about the same slim number of cattle indifferent to the fact the land they occupy could be made to double its production, at least, every ten years, for many years to come, that if they were living up to their opportunities each season would see them with a larger standard of stock of whatever kind they specialized in, and would find the farm increased in value.

However, many such men living carefully and making the most of the little they are producing are prospering and saving a little money, and do not see the need of any greater effort in their particular case. But the trouble is many others whose circumstances are not prosperous and are forced to make large yearly revenues are held down by following their example. Thus we must always remember, no line of farming that reduces the fertility of the farm is as good for the farmer as it looks to be, and any line that increases the fertility of the soil is always better than it looks to be. We cannot easily estimate the difference between a really fertile and a moderately fertile larm. There is a wealth of satisfaction in an abundant crop, in watching its development, in assitting its growth.

What man, women or child does not take delight in caring for fine looking animals in live stock of all kinds? The keeping of superior stock often keeps superior boys on the place and always makes far more intelligent farmers. This does not necessarily mean pure bred stock, because they are often beyond the means of many farmers, but everyone can have high-class grades. Grading up with pure blooded sires through the co-operation of farmers associations is a remarkably cheap way of getting into good stock, the equal often (for commercial purposes) of pure breds. It seems discouraging the indifferent ways many farmers are going about this work. There are so few instances where any breed is persistently followed in graded up long enough to establish a type or character in the herd, and for this reason very few farmers are sharing in the high prices offered for good grades of the different lines of live stock. Some improvment in this respert is being made but much too slow to keep pace with the prosperous times we are at the present experiencing.—W. M. Lea, Victoria, P. E. I.

The Conditions Essential for the Most Successful and Profitable Growth of the Clovers.

The following paragraphs we have taken from Bulletin No. 134 of the Massachusetts Experiment Station:

1. Soil conditions.—Successful clover growing is impossible unless the plants will thrive upon a considerable variety of soils as regards texture and composition, but for the best results a deep, mellow and fairly retentive soil which is well drained is essential. Clovers will absolutely fail if there is any considerable portion of free acid in the soil, or in farmer's language, if the soil be "sour." If blue litmus paper in contact with moderately moist soil turns red as it absorbs the moisture, this is an indication that the soil is sour; but the farmer will be wise if, before incuring any considerable expense for the correction of acidity, he makes a careful test for himself. One of the best farmer's tests can be carried out as follows: Take two small plots of land in a field supposed to possess "sour" soil, and plow them both. Plots containing about one square rod each will be sufficient. They should, of course, be located in a representative portion of the field. After plowing, spread about twenty pounds of builders' lime or R. R. agr cultural lime on one of the plots. Work this lime in deeply with the wheel harrow, then manure or fertilize both plots alike and heavily, and plant table beets. If the soil is sour, these beets will grow much better on the plot to which the lime has been applied than on the other, and it is safe to conclude that a heavy application of lime will be essential before clovers will flourish. If the experiment indicates that lime is essential, it will probably be needed at about the rate of one ton to the acre; the weight referred to to be taken before slacking. If air-slacked lime is used, 1½ ton to the acre will not be too much. The best season for applying lime is autumn or early spring. As a rule, it should be spread upon the plowed land and deeply worked in with the disc harrow.

2. The Use of Much Manure Inexpedient.—The writer is aware that splendid clover is often grown where the land is heavily dreesed with manure. He is not disposed to deny the possibilities of producing fine crops of clover on manure alone. He would, nevertheless, urge that manure alone be not depended upon as a means of enriching clover land. The leading and most valuable element of plant food in manures is nitrogen. The application of this for clovers in any considerable amounts is unnecessary. If clovers are grown on manures, they will feed upon the nitrogen in the manure; they will not draw from the air for that element.

Growing clover upon manure, therefore, is not the best economy. Moreover, it is important to point out that the grasses with which clover is most generally sown are greatly invigorated by heavy dressings of manure. A strong, rank growth of the timothy and redtop will tend to crowd out the clover. Fine crops of hay may be produced, but it will not be clover hay, nor rich in clover. The writer would not be understood as urging that manure should never be used on land which is being prepared for clover, although he would strongly advise against topdressing clover with manure. On soil which is naturally poor in nitrogen, manure may wisely be used in moderate amounts for crops preceeding clover. Heavy dressings would be a mistake. It is far better to use the manure in only moderate or small amounts, and to use it in connection with materials which will supply lime, phosphates and potash.

3. The Supply of the Mineral Element of Plant Food should be Liberal.—We should not forget, in considering the best means of growing clover, that the stock of nitrogen in the air, from which it is capable of drawing, is practically unlimited. The more of this nitrogen we can gather in the crop and in its roots and stubble, the better. In a certain sense, this trapped atmospheric notrogen is so much clear gain. In considering this point, it must be remembered that the clover plant, like other plants, must take the different food elements in a certain balanced proportion. Though the nitrogen the clovers need is practically unlimited in amount, they cannot make a heavy growth unless provided with a great abundance of the elements which they must take from the soil.

It is clearly unwise to lessen our chances for gathering the valuable element nitrogen from the air through failure to supply the soil elements in adequate amounts. The rule, then, in preparing for clover or in topdressing lor clover should be to supply the phosphates, potash salts, lime and possibly magnesia in great abundance. With these present in abundance, and with a soil of such a character that it will furnish suitable conditions and supply the needed moisture at critical times, enormous crops of clover may be produced.

4. The Co-operation of Bacteria is Essential.—One of the most important discoveries of recent times is the now generally known fact that the presence of certain bacteria, living in symbiotic relations with the clovers and other members of the clover family and found in nodules on their roots, is essential in order that these plants may draw upon the air for nitrogen. The nodules, which in the case of clovers, indicate the presence case of clovers, indicate the presence of suitable bacteria, are whitish, more or les elliptical bodies, of about the size of the head of a small pin. These grow singly or in small clusters, mainly on the smaller roots. They can be readily found by taking up clover plants, grown under proper conditions, with care not to break off too many of the small roots.

Bacteria, as is generally understood, are plants. They are very minute. The bacteria themselves are the veriest dust of the dust. As might be supposed, therefore, they appear to be very widely and freely disseminated, and probably through the air. The slightest currents of air must carry them. The dust from a freshly turned clover sod must contain countless millions of them. In certain quarters it has been urged that failures to produce good clover are frequently due to the absence of suitable bacteria, or to their presence in insufficient numbers. Certain experiments with sterilized soils in Amherst indicate to the writer that clover bacteria are everywhere; and it is not his belief that failures to produce satisfactory crops of clover in this state can often, if indeed they can ever, be attributed to the cause under consideration.

The writer has never seen a case where, if a soil be brought into proper condition as to drainage and freedom from acidity, and well stocked with phosphates and potash, clovers have failed to grow; and he has never observed clover plants in any locality and failed to find an abundance of nodules on their roots. It is, however, of course a possibility that there may be localities where it will pay to inoculate the soil designed for clover with suitable bacteria. This inoculation may be carried out in either of two ways. First, soil from a locality where clover thrives and where the nodules are known to be abundant may be scattered over the field where the clover is to be sown, and immediately harrowed in. Five or six hundred pounds of such soil per acre will be sufficient. Second, a culture of the proper species of bacteria may be used in accordance with directions which will be furnished with it. Such cultures may now be procured from the Agricultural College Laboratories.

These cultures are known by the name of nitro culture; but, as each species of the clover family must have its own species of bacteria, it is necessary in ordering to name the plant for which the nitro-culture is needed, as well as the area.

The Department of Agriculture first first sent out cultures in dry form, in small packages containing dry cotton and chemicals, to be dissolved in the water in which the culture is to be started. In very many cases the use of these cultures resulted in absolute failures. The dessication to which the bacteria had been subjected appeared to have destroyed their vitality. So far as the writer knows, all private companies which are now offering commercial nitro-cultures prepare them in accordance with the system first used by the government, and the presumption is that in many cases these cultures will be found valueless, and for the reason above indicated. The Agricultural Laboratories at the present time are preparing cultures in semi-fluid form. They are sent out in sealed glass vials. They have not been sufficient-

HORTICULTURE.

Breeding New Apple Varieties.

Maine needs a perfectly hardy apple producing fruit of large size, good flavor and bright red color, with good keeping qualities, firm flesh and skin to stand shipping well. One or another of the standard varieties has some of these qualities. A combination of them all in a single apple is a thing much to be desired. With an open fertilized plant, such as the apple, there is little hope of being able to obtain this combination of desirable qualities by selection alone. It would indeed be impracticable to attempt it this way. Resort must be had to the other chief method of the plant breeder, namely hybridization or crossing.

Work along this line with the apple has been undertaken by the Maine Agricultural Experiment Station at Highmoor farm. A wide series of crosses are being made between different standard varieties of apples, with the idea of first finding out how the different desirable qualities of apples are inherited. Then in the light of this knowledge it will be possible to proceed to build up synthetically a type of apple which meets the orchardist's needs.

Three years is about the shortest time in which one can hope to get even a single fruit resulting from a particular cross which he may have made. The fact that apples may be so easily propagated by grafting and budding makes it possible, when once a desirable type has been found to propagate it quickly to an indefinite extent. A study is also being made of apple seedlings. Since the apple is naturally cross-fertilized to a very large degree there is a considerable chance than by a systematic study of seedling apples desirable combinations of qualities may be found. Indeed, it is in this way that some of the most valuable of the standard varieties of apples have been originated in the past.—Charles D. Woods, Director Experiment Station. Maine.

Luncheon to Prof. Blair.

On Friday evening July 12th. at the Aberdeen Hotel Kentville, N. S. a complementary luncheon was given to Professor W. Saxby Blair, who has resigned as Professor of Horticulture at McDonald College, Montreal, to take up the position of Superintendent of the Horticultural Farm at Kentville.

President Ralph Eaton occupied the head of one of the tables and at his right sat the guest of the evening. Mrs.Blair was unable to be present. There were two tables well filled with members of the Board, including Mr. I. B. Solomon of the Canning Board of Trade.

After luncheon had been served and toast to the King presented, the Chairman gave an excellent introductory address stating the important positions that Mr. Blair had occupied, the pleasure it gave the Kentville Board of Trade and others that Prof. Blair had decided to take the position here and the important work which can be done on the Horticultural farm under such competent management. Mr. Eaton also gave many items of interest on the prospective fruit crop of the Valley in future years.

The toast to the Mayor and Town Council was responded to in neat addresses by Mayor Yould, Recorder Webster and Councillor Mc Bride. For the learned profess ons responses were made by Rev. T. C. Mellor, Judge Chipman, Dr. W. B. Moore, W. P. Shaffner, A. V. Pineo, Chas. W. Webster, and the mercantile and business professions by Mr. Lombard, J. W. Ryan, E. B. Newcombe, T. P. Calkin, G. E. Calkin, A. L. Hardy etc.

Mr. Blair when called upon to speak was received most enthusiastically. He said he had some misgivings in leaving such an important position as he did at McDonald College the best equipped Horticultural College in America and he had been identified with the work there from its inception. There was something drawing him back to Nova Scotia which he now found was the hearty good will of the people there assembled and others. Both Director Grisdale and Prof. Macoun had thought that he might be of more use here as the head of the Horticultural Station at Kentville. He has imbibed the desire to be a horticulturist while at Wolfville under Professor Faville and the enthusiastic fruit growers he came in contact with while there. He considered the outlook for this station very bright, it should be made the most important horticultural station in the most important fruit growing district in the world. He would do everything possible to work out some policy here which would be of benefit to the fruit growers. He planned on pushing the work forward here for all he was worth, to make the station, if possible, one of the best in the world. This would cost money but it would be money well invested. He must of necessity make experiments here to obtain methods best suited to the requirements of the fruit district and to bring about the better care and better working of orchards. In a very few years we can accomplish much here, and make the farm one of profit to all and the ravine in connection one of the beauty spots of the earth.

Great pleasure was expressed by all that Nova Scotia was bringing back to reside here one of her most talented sons.—The Advertiser, Kentville.

The St. John Board of Trade Orchard.

At a meeting held in St. John on July 17th., it was decided to buy a farm of about fifty acres located within sixteen miles of the city and a short distance below Brown's Flats. The land is said to be ideal for the growing of apples and other smaller fruits. The land is at present under crops but it will be taken over early in the fall and preparations will be made for planting trees next spring.

The plan of providing these model fruit farms has been taken up by several boards of trade in the Province and these farms will be under the direction of the government experts for six years and accurate accounts of the expenditure and income will be kept so that it can be shown just how successfully this kind of a farm can be operated in New Brunswick.

The Moncton Board of Trade has the matter under consideration also and it is expected that in a few days the Moncton board will also have acquired a site for a farm.

Members of the St. John company seem very enthusiastic over the land secured by them and it is believed that the farm will be successful from the start.

More Apples Imported Last Year by Barbadoes.

During each year a small number of apples reaches this market from Canada and the United States and some from England. It appears that last fall and winter the quantity imported was somewhat above the average, and as the fruit in most cases arrived in good condition, better prices were obtained than formerly. All apples coming into Barbadoes are on consignment, and if in good condition, find ready sale. A small quantity comes direct from Canada by the Pickford & Black steamers, the largest part is received through New York, with which port there is a more rapid service. It is stated, however, that some at least of the apples received through New York are Canadian. The varieties which seem to stand the voyage best and find readiest sale are Baldwins, Spies and Russets. If shipped in moderate quantities, and not allowed to chill before leaving Canada, the fruit reaches here in fairly good condition, and with a little more effort a slightly extended trade might be developed. —E. H. S. Flood, Trade Commissioner, Barbadoes, B. W. I.

United Fruit Companies Meet and Organize.

The meeting of the United Fruit Companies of this Valley, called to meet in the Court House July 12th. called out such a small attendance that it was adjourned to Monday. On Monday morning the adjourned meeting was held in the Y. M. C. A. hall and after preliminary proceedings for organization, the following list of officers were elected for the ensuing year:—

President, John Donaldson, Port Williams.

Secretary, M. B. Davis, Bridgetown.

Directors from fruit companies;

Canard, Lewis Halburton.
Cornwallis, A. S. Banks.
Middleton, F. M. Chipman.
Starr Fruit Co. of Paradise, J. E. Morse.
Kingston, F. W. Foster.
Roundhill, F. E. Mason.
Aylesford, A. E. McMahon.
Waterville, F. M. Chute.
Central, A. P. Rumseyi
Kentville, C. O. Allen.
Mayflower, E. I. Loomer.
Maple Leaf, C. W. McKeen.
New Minas, E. H. Johnson.
Grand Pre, A. H. Westcott.
Paradise, F. W. Bishop.
Bridgetown, S. L. Marshall.
Enterprise, H. Messenger.
Granville, H. Miller.
Port Williams, M. K. Ells.
Kingsport, H. R. Kinsman.
Pleasant Valley, T. H. Morse.
Sheffield Mills, J. E. Taylor.
Berwick, J. N. Chute.

The organization will be known as the "Central Association" of the United Fruit Companies. Twenty four out of twenty seven fruit companies in the Valley, were represented by seventy eight delegates. A very full discussion of all subjects connected with the business, was had and the intention expressed of so developing the work of the association along the lines of similar organizations in Great Britain, as will make it more fully co-operative in its scope. A meeting of the directors was held at the close of the general meeting, and initial arrangements made for the business of the coming season.

Summary of July Fruit Crop Report.

WEATHER CONDITIONS.—Not unfavorable for tree fruits. Somewhat hot and dry for small fruits during July.

APPLES—Prospects have depreciated since last month. Nova Scotia expects only 52 per cent. of a full crop, Ontario a medium crop, and British Columbia has still prospects for a record yield.

PEARS.—Eastern Canada medium crop only, British Columbia good.

PLUMS—Below medium in Eastern Canada, good in British Columbia.

PEACHES—Notwithstanding the injuries resulting from the severe weather of last winter, a fair crop will be harvested in the chief commercial orchards.

CHERRIES.—A fair crop of early cherries has been harvested; sweet cherries decidedly short.

GRAPES.—Good crop everywhere.

SMALL FRUITS.—Strawberries short in Eastern Canada and prices correspondingly high. Raspberries shortened by dry weather. Currants and gooseberries good, blackberries decidedly short. In British Columbia, small fruits have been a heavy crop.

TOMATOES.—Medium crop.

Insects and Fungous Diseases.—The ravages of the Tent Caterpillar caused much damage in New Brunswick, Western and Southern Quebec and Eastern Ontario, many of the orchards being completely defoliated. Apple scab is showing in District 6. Blight has done more than the usual injury in pears this season. —J. A. Ruddick, Commissioner. and A. McNeil, Chief, Fruit Division.

The Vegetable Garden.

When Parliament was in session a number of very useful papers on Agricultural topics were read by prominent authorities before the Standing Committee of the Senate on Agriculture and Forestry. One of these by W. Saxby Blair, Professor of Horticulture, Macdonald College, Quebec, deals with the growing of garden vegetables. After pointing out certain important details more or less common in their application to all vegetable crops, the author follows with more specific information relative to the growing of many of the principal vegetable crops grown in this country. Among other important points taken up are the construction and management of hot beds and colo frames, kinds and application of manures, tillage, successful sowings, etc. Among the crops dealt with are tomatoes, onions, cauliflower, celery, melons, parsnips, beets, salsify, egg plants, spinach, sweet herbs, asparagus, etc. Of all these and others desirable varieties are named. This paper is issued as apamphlet of seventeen pages and is being distributed free by the Publications Branch of the Department of Agriculture at Ottawa.

Complaint Regarding Apples.

Local produce dealers are not satisfied with the apple trade the last few years. They seem to think that the Dominion standard law defining quality only applies to apples exported to England, and that as a consequence only an article of inferior quality is exported to this market.—W. B. Nickolson, Trade Commissioner St. John's Nfld.

After-Culture of Vegetables.

During tne long spring drought vegetables made little progress, but now that the weather has broken growth is active and the market gardener finds work on every hand. Some of the seeds sown during the dry time remained almost dormant in the soil, but the seedlings are all appearing at once now, and thinning is urgently called for. This is the first requirement of most vegetable crops, and it ought to be done as soon as the seedlings are large enough to handle, which is generally when they have made one leaf in addition to the two seed leaves, for overcrowding is to be avoided at all

times. The amount of thinning to do is sometimes a puzzle to the inexperienced. The best plan for them is not to thin in one operation, but merely to single the seedlings at first, and leave the final thinning until later. There may be losses from insect pests and other causes before then. With some crops, notably onions and carrots, there is no need to give the final thinning before the roots removed are large enough for sale. If good seed is sown on soil in a high state of cultivation the preliminary thinning can practically be avoided.

HOEING

In directions for growing vegetables we generally find the phrase, "Hoe to keep down weeds." But hoeing does far more than that. It is almost equal to a dressing of manure, particularly in a dry time. The only point in favor of weeds is that they force growers to hoe more often than they would otherwise. The stirring of the soil is of the greatest value. The first hoeing ought to be given as soon as the seedlings show in the rows, and the operation can hardly be repeated too often for the benefit of the crop. The most important time to hoe is as soon as the surface is dry enough after rain. The effort then is to break up the cap and form a layer of loose soil on the surface, which has a marked effect in preserving moisture down below among the roots; and you never know how long it will be before another shower will fall. Wherever possible horse-hoeing should be practised between the rows, for economical reasons, but hand hoeing is necessary in the rows and close to them. Avoid drawing soil away from the plants. Rather do the opposite with crops that seem to want a little support, such as dwarf peas and beans.

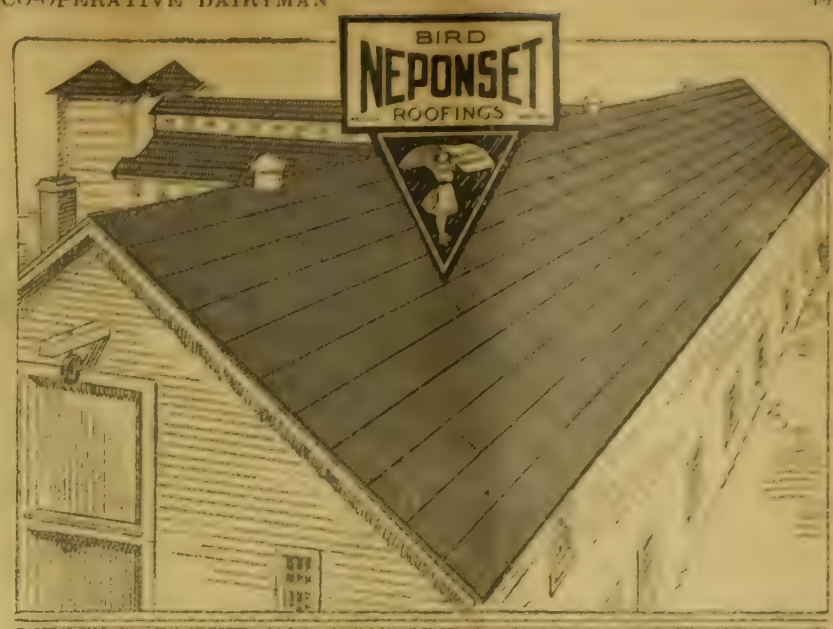
Where there are many weeds the ordinary draw-hoe is the best implement to use, but on light land in fairly loose condition, the Dutch hoe makes good and rapid work. A tool that is proving very useful this season is the Canterbury hoe, which deserves to be more widely used. It is particularly helpful on heavy land that has capped hard or is cloddy. A large area can be got over very rapidly, and stirred deeply, too; but it is of little use for weeds. To stir the surface in preparation for planting out it is capital. Any big clods that are pulled up can be broken down with a blow with the back of the hoe, treatment often needed this season on heavy land.

FEEDING THE GROPS

Closely connected with hoeing is the application of top-dressings or of liquid manure. These are called for by practically all green crops and roots. There is nothing to beat well diluted liquid manure, but the labor of its preparation and application is generally prohibitive on the market garden. But quite as good results can be had from the use of nitrate of soda or nitrate of lime. The secret is to give little and often. Such gradual feeding has a wonderful effect on green crops, such as cabbages. Just a dusting along the rows close to the plants is the most economical plan, or even round each plant. Shortly before or after a shower is the best time. It is during the early stages of a crop's growth that such help is most needed. Over-stimulation has to be avoided, but the benefit of judicious top-dressing must be seen to be believed. Early-sown turnips call for the treatment now, for they are badly troubled with the "fly" in many cases, and this helps them to grow away from the pests.

EARTHING UP POTATOES

Do not be in a hurry to earth up potatoes. They are a sun-loving crop, and like to be near the surface. On the other hand, do not delay until the tops hang over in the rows. Horse-hoe between as soon as the tops are visible. This loosens the soil about the tubers and is very beneficial. With very early potatoes the case is different. These run a risk of injury from frost, and can be protected to a considerable extent by earthing up little and often from the first.—E. Mayhew.



Not a Leak in 13 Years

From a section where the climate is hard on roofing comes this letter:

"John Tupper built a lumber shed 13 years ago and roofed it with

NEPONSET PAROID ROOFING

The building is now partly pulled down and the roof has sagged. There are low parts where the water stands after a rain, but the water evaporates without going through the roofing. No attention has been given to the repair of this roofing for 13 years, and still it does not leak."

The economical roofing is the one that you *know* will last. Actual records prove that NEPONSET Paroid Roofing is the real rival of best shingles in long wear. It costs less to buy and less to lay—in addition gives fire protection.

The U. S. Government has used over a million square feet of NEPONSET Paroid Roofing on the Panama Canal alone. Farmers are buying it for their biggest and best barns.

Remember the name, NEPONSET Paroid, the roofing with the record. Make sure that you get it. Sold only by regularly authorized NEPONSET dealers—leading hardware and lumber merchants.

DAIRYING.

Individual Stalls for Cows.

We hear so much now about the individual drinking cup. How about the cow's individual stall? Each cow obtains her food by means of her tongue, and licks her manger clean daily. It is much better for her to lick her own manger than it is for a different cow to do the operation every day and possibly spread disease. Cows soon learn to take a stall and be orderly.

As a rule a man's dairy is not confined all to winter cows that receive a heavy grain ration, and sometimes he wishes to fatten a cow. In such a case, the neighbor of a heavy grain-fed cow is robbing that cow of a portion of the grain she should have, and gaining on her own amount which has been assigned to her. Many times cows in the center of a row where there are no dividing manger partitions have no hay because they have shoved theirs to one side to lick up a choice morsel. The next cow has done the same, and thus the center ones have none and the end cows have a surplus, or vice versa as the case may be.

Give the cow a manger and it is more easy to feed the amount of hay or fodder she may need. No two cows eat the same amount any more than two persons. The cows then get what they require and if a cow fails to clean up her hay or grain it will be seen more readily and the cow will not go "off her feed" as she might otherwise do if she did not feel ,ike eating her own ration and the cow on each side helped her out.—L. L. Nichols, Chenango Co, N.Y.

Keeping Cream Sweet.

As the warm season comes on, the difficulty of keeping cream sweet on the farm becomes greater. The farmer is busy looking after his crop and is liable to neglect taking his cream to market as often as he should, consequently the cream is not in good condition when it reaches the creamery or ice cream factory. Many times the farmer is also negligent in the care of the cream when he is busy in the field.

Then, too, the cream requires extra good care in the warm season. High temperature promotes the growth of germs in the cream which in turn causes the souring. There are two main factors to consider in keeping cream sweet. The first is cleanliness, and the other is low temperature. To these might be added a third, which also plays some part in the souring, namely, the per cent. of butter-fat in the cream.

When filth gets into milk or cream, there are innumerable germs introduced, which if left to develop at proper temperature multiply very rapidly. The less filth in the cream, the longer it will remain sweet. This emphasizes the need of absolute cleanliness in the handling of milk and cream.

Low temperatures tend to check the development of the germs and thus retard the souring of the cream. It is important that the cream be cooled down at once after it comes from the separator. At any rate, the morning cream should always be cooled before being added to the cream of the evening previous.

The richness of the cream has an effect upon the souring. Cream with a high per cent. of butter-fat does not sour so quickly as thin cream. The souring of cream is caused by the action of germs on the milk sugar. Where there is a high per cent. of fat, there is necessarily a lower per cent. of other constituents. The action of the germs is that of changing the milk sugar to lactic acid. Where there is less milk sugar, there will be a less amount of acid developed and thus the souring is checked for a lack of milk sugar. The separator should be set to separate a cream containing about 35 per cent. of butterfat. In some cases it is possible to have as high as 50 per cent. of butter-fat in the cream. However, such cream is usually difficult to pour from the can. This is especially true however, in the winter.—G. E. Frevert, Idaho Experiment Station.

Creamery Egg Collecting.

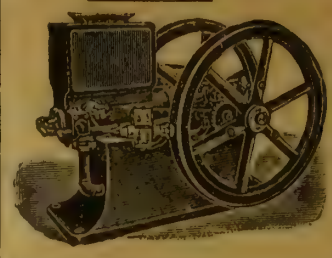
Albert Lowenfels of New York, writes in the Dairy Record (Vol. 12, No. 50, page 10) urging the creameries to collect and ship eggs, and I ought perhaps to hail him as a confederate because I have been among the first to point out this plan—not so much as a profit to the creamery, but as of great advantage to the farmers. But I notice that while we agree in the desirability of the plan, we are far apart as to the manner in which it should be carried out. He urges that "If they are gathered from three to six times a week, as they would be under the creamery system (he should have said whole milk system) then they would not have the chance to spoil and would not need candling at the creamery.'j

This is a fundamental mistake and would do away with the greatest advantage of the system, which is to prevent the often erroneous loss in shipping and paying freight for bad eggs. The candling at the collecting point is absolutely necessary for the success of the plan as is a designating number on the egg to enable the tracing of its origin if desired. I shall leave the dating out of this discussion. What security has the creamery that the eggs collected today were laid the day before and not the previous week when 5 or 6 eggs are found in a stolen nest, not to speak of the full dozen? No, not only must the eggs be candled at the creamery but the number must enable the buyer—be it a private consumer, retailer or merchant—to report eggs which though candling are good enough to ship are not really fresh laid eggs and hence rot too soon. The very knowledge of the farmer that the eggs delivered by him may be identified, even when taken out of cold storage six months later, will be an incentive for him to see that they are not only collected every day but kept clean and in as cool a place as possible.

A. L. also declares the system where farmers box the eggs in cartons of 1 dozen each and seal these with his number (which system might make the handling superfious) to be a splendid one provided the creamery can sell them directly and he correctly says that this will not be practical for all. But why could not he and other merchants receive and sell boxes with 24 to 36 cartons of eggs sealed with the creamery mark say A in a circle or triangle or what not, with the eggs numbered with the producers number? Unless eggs so collected can secure a premium over the eggs collected under the present haphazard system there is no cause for the creameries or for the producers to bother about it and the latter may as well trade them for groceries at the local stores

But there is no need for the individual cartons when each egg is numbered and candled at the creamery. Nor is there need of using the creameries if the local storekeepers will candle and handle the eggs as they ought to, hence in my opinion, it is up to the farmers to insist on this or to organize co-operative egg collecting stations eventually in connection with their creamery.

A New Name For The Best Farm Engine



Made in Air-Cooled or Water-Cooled Styles. Sizes 1 1-2 to 20 h.p.. Send for catalogue, prices and buying terms for farmers.

We have changed the name of our famous "CANADIAN" air-cooled and water-cooled engines to a name that also signifies quality.

Hereafter, these engines will be known as the "MONARCH."

It is a Monarch among farm engines. No engine runs better, is more compact, easier started, surer and steadier than this. Always remember the 'MONARCH.'

Every part is true to 1-500 in. or less. Experts work on each part. Material is the best money can buy. Bearings are big and wide, The design is compact, and every part is reachable. The "MONARCH" is reliable, simple, durable, powerful and dependable. Easy buying terms. Write us for catalogue. Our Company has a new name, too :—

Cow Feeding Experiments.

The North Carolina experiment station recently concluded a number of experiments to determine the relative efficiency of narrow and medium wide ration for milk production.

Eight cows from three to six weeks in lactation were fed three periods of 28 days each. In the first and third periods the feed consisted of five parts cottonseed meal, four parts wheat bran, three parts corn meal, and 50 pounds of corn silage. The nutritive ratio of this ration was about 14. During the second period the ration was the same as the above except that 2.5 pounds of cottonseed meal was replaced by 2.5 pounds of corn meal, giving this ration a nutritive ratio of about 1.5.7 The results of this test indicate that the narrow ration produced 7.5 per cent. more milk fat and increased the fat test 0.24 per cent., and the live weight 30 pounds. The milk yield was practically the same. This trial was duplicated with five cows, except that the narrow ration was fed during the first and third periods, and the medium ration during the second period. The narrow ration produced 7.6 per cent. more milk fat, increased the fat test 0.17 per cent. and the amount of milk 93.4 pounds, the live weight remaining the same.

In an experiment to test the relafeeding value of cottonseed meal and linseed meal for milk production, it was found that the former gave only slightly more returns than linseed meal. Notwithstanding the greater cost of linseed meal the station officials advise the use of small quantities on account of its tonic effect.

Making Dried Milk.

In the manufacture of this milk powder the milk, either whole milk or that from which the cream has been removed by the separator, is first filtered through a cotton medium whereby all foreign substances held in suspension are removed. It is then cooled by means of refrigerating apparatus to a point just above freezing and kept at this temperature until ready for the "exsiccator" or milk-drier apparatus. This device consists of a large cylindrical drum which is caused to revolve. The internal surface of the drum is nickel. The milk flows through flexible tubes into the exsiccators by gravity. A high vacuum is maintained in the drum and as it revolves the dry solids of the milk accumulate on the inner surface of the drum. An evaporative effect of 160 to 180 kilograms per hour per square meter (295 to 330 pounds per square yard), is said to be obtained by the Ekenborg apparatus. German silver knives scrape off the dry milk deposit on the nickel surfaces of the drum and deposit it in a special receptacle close to the drum. After removal the dry milk is

Better Butter And Better Prices

These are the two big reasons why you should use Windsor Dairy Salt.

If you make your living out of the butter you sell, then anything that will make the butter better will make more money for you.

and allows cows to feed in peace, making **More Milk** and **More Money** for you. A clean, harmless liquid preparation, applied with a sprayer. Keeps cows in good condition, and saves five times its cost in extra milk.

TRIAL OFFER

If your dealer cannot supply you, send us his name and $1.25, and we will deliver prepaid to your address a half-gallon can of COW-EASE and SPRAYER for applying. For West of Missouri River and for Canada, above Trial Offer, $1.50.

Satisfaction or Money Back.

CARPENTER-MORTON CO.
BOSTON, MASS.

Annapolis Valley Fruit Farm.

$3050 Income Last Year.

220 acres on salt water; splendid boating, fishing and bathing; 5 minutes' walk to P. O. and boat landing; 8-room painted house, running water, large barn; orchard producing 400 bbls. apples in season; cuts 30 tons hay, besides large acreage used for crops; wood and timber valued at more than $1000; pasture for 40 head; extreme age of owner necessitates immediate sale; price only $3200, part cash, easy terms; a splendid opportunity for one to get located in this famous fruit section where values will double and treble; for set of pictures, full details and travelling instructions for this and other Nova Scotia farms, write The MARITIME FARMER, St. John, N. B.

During the summer months mothers of young children should watch for any unnatural looseness of the bowels. When given prompt attention at this time serious trouble may be avoided. Chamberlain's Cholic, Cholera and Diarrhoea Remedy can always be depended upon. For sale by all dealers.

subjected to a crystallyzing process at a temperature of 80 to 100 degrees F. until the sugar of milk is perfectly crystallyzed. The dry milk, it is stated, will then keep in any climate indefiinitely, without any special precaution. The evaporation in the drum is aided by heat from exhaust steam, although, it is stated, the temperature of the milk being dried is at no stage of the operations much higher than lukewarm.

To Prevent Milk Fever.

A correspondent writes: In an experience covering a good many years, I never had a case of milk fever. Some of my neighbors have, and I have learned a little something from their experience and my own practice. In the first place, I never feed a cow meal for three or four weeks before she is due to calve. I substitute for meal wheat bran in fairly liberal rations. This is cooling to the system, keeps the bowels regular, and, on the whole, is a fine article of diet in the spring. Then, after the cow has passed the crisis, I do not permit her to drink for two or three days of cold water. I see to it that she is furnished plenty of cool water, carrying down warm water enough to take the chill off what is given her to drink.

Importance of Testing.

There is a common opinion among creamery inspectors that testing does not occupy the promonent place it should in creamery practice, indicating that few are familiar with the disastrous results of careless testing and practices of sampling which may lead to an inaccurate determination of butter fat. If the test applied to creamery weights is to be used as a basis for payment, then it bears the same relation to that industry that a system of weights and measures does to any commercial business.

Few realize that the creamery overrun will, on a 40 per cent. cream basis, be increased or decreased three per cent. by introducing an error of one per cent. in testing. This means, in a plant averaging 700 pounds of butter daily, a loss or gain of 21 pounds of butter, worth about $6—salary of two good men. Thus it becomes evident that any practice resulting in a test uniformly high is a source of constant drain to the plant. Should the error fall in the opposite direction, the plant must sooner or later suffer from a list of dissatisfied patrons.—Illinois Bulletin.

Why I Shall Milk.

1. I need fresh milk, cream and butter on my table.
2. It means a steady income every month.
3. It means enough equal division of labor throughout the year.
4. To ensure profitable crops I must practice clover or alfalfa rotation and must find a profitable market for these crops.
5. Dairy cows furnish the most profitable market for these crops, returning about two dollars of products for every dollar's worth of feeh fed at average prices.
6. Dairy builds up rather than depletes soil fertility.
7. Dairy products remove less plant food from the farm than any other crop.
8. The dairy cow is the most economical producer of humane food.
9. There is an increasing demand for high-grade dairy products.
10. Maritime soil, water and climates are especially adapted to the production of an abundance of dairy products of the highest quality.

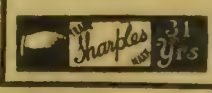
GOVERNMENT EXPERT

Chooses SHARPLES Tubular Cream Separators for His Three Farms

Like other shrewd farmers, Mr. Anson Groh, widely known agricultural lecturer employed by the Government, knows the money to be made in dairying. He has succeeded because he knows profit is of far greater importance than first cost. Mr. Groh is seen sitting in this picture, with his family and assistants, before his country home. Like others making most money from dairying, Mr. Groh selected the Tubular in preference to all others because the Dairy Tubular contains no disks or other contraptions, has twice the skimming force of other separators, skims faster and twice as clean, and pays a profit no other can pay. Mr. Groh says:

"Preston, Ontario, May 28, 1912.—Some years ago we selected the Sharples Tubular. After a few years' use we found it necessary to get another separator for another farm and selected a No. 6. After several years' service of these two machines, we would not think of introducing anything else on our third farm, recently purchased. ANSON GROH."

Now you understand why owners of other separators are discarding their machines by carloads for Tubulars. Follow the example of Mr. Groh and the many others who have succeeded. Buy a Tubular for the sake of double skimming force, easy cleaning, and all the profits.



Get quick attention by asking for Catalog 194

The Sharples Separator Co.
Toronto, Ont. Winnipeg, Man.

Everybody's Favorite

These strong features make the WATERLOO BOY Beltless Pumping Outfit a universal favorite:

First--Simplicity, no belt to stretch or slip. In point of simplicity, strength and price there is nothing on the market that compares with this outfit.

Second---Strength. The strongest puller on the market.

Third---Low Price. A geared engine and pump Jack. Lower than ever before offered.

LIVE STOCK.

The Digestive Process in Cattle.

The first changes in the food are effected in the mouth, where it is mixed with saliva, a fluid essential to preparing it for the further alteration it has to undergo in the process of digestion in its passage along the alimentary canal.

In the ruminant the food receives but very little chewing or mastication when first taken into the mouth, this being reserved for the subsequent process known as "cudding." There is not the regular grinding between the molar teeth to which the horse subjects its food before swallowing it, but only a few hasty movements of the jaws, and a slight admixture of saliva, after which it is carried by the action of certain muscles into the opening of the oesophagus.

THE USES OF SALIVA

in relation to digestion are partly mechanical and partly chemical. It moistens dry foods by adapting them for deglutition, and tends to separate the particles, and so allows them to be acted on more freely by other digestive fluids. The great chemical use is to convert the amylaceous or starchy portion of the food into sugar.

Saliva is a fluid secreted by glands which occur in three distinct pairs, and its action on starch, described as the amylolyic action, is due to the presence of a principle called ptyolin, which acts the part of a ferment.

These glands are known as the parotids, sub-maxilliary and sub-lingual. Few have any idea of the quantity of saliva that is secreted during twenty-four hours. The parotids secrete constantly, but most markedly during feeding. Sub-maxilliary saliva is also constantly produced, but is more abundant during mastication. The three salivas have different physical properties, but mixed saliva is an opalescent or slightly-turbid fluid which has an alkaline reaction. With reference to the total quantity of mixed saliva produced, Colin places the daily secretion of saliva in the ox at 112 lb., but the amount depends on the dryness of the food consumed.

After the food has been roughly chewed and mixed with saliva it is pressed by the tongue against the palate, and so squeezed back into the funnel shaped receptacle called

THE PHARYNX.

The pharynx is not only to pass the food onward into the oesophagus or gullet, but to guard against its entering the larynx, and so getting into the tracea or windpipe—or, in popular phraeeology, to prevent its "going the wrong way."

During unconsciousness, or when being hurriedly drenched, and the animal coughs, there is sometimes an escape into the long passage owing to this guard being relaxed. When the food gets into the grasp of the pharyngeal muscles, it is pushed into the oesophagus, and is carried down this tube by a continuous wave of contraction, which starts at the pharynx and ends at the rumen, into which pouch it opens.

THE ŒSOPHAGUS

is a canal which differs somewhat in different animals, but in the ox is composed of red muscle throughout, and lined with a mucous membrane. It has only a loose connection with the parts through which it runs to the rumen—a beautiful provision of nature to reduce the risk of impaction or choking. In addition to its loose attachment, its elastic structure and thin distensible walls permit the passage of very bulky material, the advantage of which is obvious.

What the ox and dog can swallow with ease, and neither does much preliminary chewing, would certainly "choke" the horse.

In our opening remarks it was said that every farmer knows that the stomach of the ruminant is divided into several compartments or pouches, but it is not every stock-owner and feeder who knows their names and uses, for there is frequent confusion of terms, and, therefore, mistakes in describing the part of the gastric mass supposed to be obstructed or diseased.

The four compartments into which

THE STOMACH OF THE OX

is divided gives to it an entirely different appearance, apart from its bulk, to the organ of single-stomached animals, which is only a pouch-like dilatation of the alimentary canal, in which the food makes a comparatively short stay.

The largest cavity, and that into which the food is carried direct from the mouth, through the oesophagus, with very little preparation, is the rumen, or first stomach—called also the "paunch" or "maw."

It occupies three-fourths of the abdomen, and is situated on the left side. It is the seat of the common trouble known as "hoven" or "blown," and it is essential to be acquainted with its position, because it sometimes has to be hurriedly punctured to let out the gas with which it becomes distended in acute cases of "hoven."

It must be understood that this reference to its size and position applies to the adult animal only, and that in the juvenile the abomasum, or true digestive stomach, has the largest capacity while milk is the food, and until it becomes developed by feeding on hay and grass. The organ has three coats: the external peritoneal coat, the middle or muscular coat, and the inner or mucous coat.

The layers of the muscular coat are composed of fibres lying in different lines, so that the stomach can be contracted in several directions, and by successive contractions the food is made to revolve in the stomach, like milk in a churn.

The muscular coat, too, is arranged to form bands in certain situations, and thus the cavity of the rumen is divided into four compartments, of which the left is the largest.

THE SECOND STOMACH,

technically the reticulum, hangs below the termination of the gullet, between the rumen and the diaphragm or midriff, It is popularly known as the "honeycomb," from its mucous surface being dimpled with hexagonal depressions or pits. In these cells are often found stones, nails, wire, &c., and the reticulum is frequently the seat of foreign bodies that occasion indigestion. The contents are always fluid.

THE THIRD STOMACH.

or omasum—called also the "fardel," "farthing," "manyplies," and "manifold"—has its mucous membrane arranged in thick longitudinal folds, so that a large surface is packed into a small compass. The contents of this stomach are always dry, due to the fluid portion being squeezed out by the powerful pressure of the muscular "leaves," and flowing into the fourth stomach by the action of gravity.

THE FOURTH STOMACH

or abomasum, is the true digestive stomach, popularly known as the "reed" or "rennet." It is a narrow, elongated pouch, with a much more vascular mucus membrane than the others, secretes gastric digestion that takes place in the single organ of animals that are not ruminants.

The action of its secretion in coagulating milk, of which use is made in the manufacture of cheese, is well known.

Castrating the Young Pig.

The castrating of young pigs is too often neglected and deferred longer than it should. To wait until the pigs are well along, not only makes the operation more difficult, but it is also harder on the young pigs. There is also more danger from infection by flies during warm weather. The best time for castrating is when the pigs are from three to six weeks old, or if possible during cool weather. At that age the pigs are strong enough so that the operation will not give them much of a setback. At that time they are usually with the dam and in good and thrifty

The New Perfection Toaster

Anyone, even a little girl, can make toast on the

New Perfection WICK BLUE FLAME Oil Cook-stove

She will not burn the toast, and she will not burn her fingers either, if she uses the New Perfection Toaster.

For toast or roast
For boil or broil
For fry or bake

there is no other stove that is as quick and as handy as the New Perfection Oil Cook-stove — the convenient stove for all purposes, all the year round.

Every dealer has it. Handsomely finished in nickel, with cabinet top, drop shelves, towel racks, etc. Long chimneys, enameled turquoise-blue. Made with 1, 2 and 3 burners. Free Cook-Book with every stove. Cook-Book also given to anyone sending 5 cents to cover mailing cost.

"INTERNATIONAL FLY WAY"
Prevents the Tremendous Loss from Flies

Flies cost the farmers of Canada millions of dollars annually by retarding the growth or fattening of animals and by greatly reducing the production of milk by constantly annoying the animals all summer. Every farmer or stockraiser knows this statement to be true from his own experience.

Flies also cause a great loss of life by Spreading Diseases from farm to farm. "International Fly Way" will keep flies off your animals and give them perfect rest from these pestilentious insects, which will make you more money in a larger production of milk or much quicker growth of all animals.

SAVE YOUR STOCK
By Using
"INTERNATIONAL FLY WAY"

It is positively guaranteed to be effective in Driving Away Flies, Mosquitos, and other insects which worry stock and reduce their earning capacity. It is harmless to the hair and skin and will be found perfectly satisfactory when used according to directions.

We place our twenty years of reputation back of "International Fly Way," and ask you to test it on our positive guarantee.

FOR SALE AT ALL DEALERS.

THE St. JOHN Business COLLEGE

S. KERR
Principal.

For soreness of the muscles, whether induced by violent exercise or injury, there is nothing better than Chamberlain's Liniment. This liniment also relieves rheumatic pains. For sale by all dealers.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

condition, or at least more so than immediately following weaning time. Castrating before weaning also means that there will be nothing to disturb the growth of the pig after weaning.

In castrating an incision is made through the skin of the scrotum aud the inner membrane that encloses the testicle. Make the cut low, so that the fluid may drain out of the opening, and in a line parallel to the midline. By cutting through the membrane, it is allowed to drop back, the testicle drawn out and the cord drawn out and cut. In severing the cord it is better not to make a sharp cut, but rather scrape it off. This will mean less bleeding than where the cut is made abrupt. A separate incision should be made for each testicle, so as to avoid cutting across the midline.

It is a good plan to have a weak solution of either carbolic acid or coal tar dip to be used as an antiseptic. Wash the outside of the scrotum before making the cut. After the operation is over with, it is a good plan to wash the wound with the solution. thus guarding against infection. A clear, bright day should be selected for the operation, as there is then less danger of the pigs lying around and becoming cold and stiff. A good, clean grass lot is a desirable place to turn the pigs out on as there is usually little dnst and no mud in such places. Two persons can do the work to best advantage; the person holding the pig, taking both right feet in his right hand, the left feet in the other, and thus holding the pig in an upturned position resting its back on a bench or fence.

Beef Producing.

The farmer of to-day must study the cheapest and quickest way of producing beef if he means to compete against his friends abroad. To begin with, have a good calf from a good cow, for if the calf be a poor one it pays better to kill it at once than to attempt to produce beef. Let the calf suck the cow, and it thrives the best, but this spoils the cow for milking purposes. When not sucking the cow, the calf requires as much of its own mother's milk (preferably) as it will drink at equal intervals three times a day. In this manner feed the calf for eight or ten weeks, then give some hay or rolled oats to obtain the cud, and add some boiled linseed to the milk, which can now be reduced to twice daily. After a few more weeks the calf can be given skim milk and fed in the usual manner. *i. e.*, cake, fodder and hay, until about twenty-four months old. At twenty-four months old the beast, if it is has had a fair allowance of feed during the past twenty months, should be making headway towards beef, but it is the last three to six months where the time and expense is incurred. The treatment of the beasts during the last three to six months is to tie them up, and only turn them out to drink twice a day. If there is any skim milk to spare, give it to them along with a solution of feeding treacle, which they will drink freely when accustomed to it. Dissolve the feeding teracle in boiling water. and add to it the chopped hay and Indian or bean meal the previous night. Next morning take about 6 lb. or 7 lb. of fodder as above, and also allow the following per beast:—7 lb. to 10 lb. mixed cake (Egyptian cotton and soya cakes), and a small amount of linseed cake. Repeat the fodder and cake twice daily, and give hay at discretion, *i. e.*, as much as can be eaten. By the end of the six months the beast should be ready for any butcher, and will also be in good condition.

Summary of beef producing:—(1) Good calf, well fed on milk as long as possible. (2) A fair allowance of food between the age of six and twenty-four months to uphold the condition derived from the milk. (3) When tied up to feed, do not neglect, but fatten as quickly as possible. Note:—This last few weeks beef has been very dear, and no doubt has paid the farmers for once

S. D.

YOUR VITALITY CAN BE RESTORED

Strong, vital, healthy manhood fascinates all who come in its influence. As true as you are a living, breathing human being, I can restore your VITAL strength, there is not a question of a doubt as to what I can thus do. BUT there is a single condition, one restriction I put a certain solemn promise I exact from you before you can exact a promise from me; namely: you must unconditionally agree now at once and forever to discontinue all dissipation; with this out of the way I will do the rest. Remember what I say; no matter what your present condition, no matter what has happened in the past, just forget it and put yourself in my hands; everything will come out as you wish it. I use no drugs, no lotions, no medicines; I place no foolish restrictions upon you; just lead a natural life, get all the enjoyment you possibly can, but cease dissipation; always remember that. I can then restore your vital energy: I can take you out of the half-man class and put you in the spotlight of full, healthy, contented vigor; I can make you feel young again and keep you feeling young to a ripe old age, because I drive into your system the one thing which keeps the whole organism in balance, namely, VITALITY. My HEALTH BELT with suspensory attachment is the greatest single self-treatment remedy or VITALITY RESTORATIVE that the world has ever known, or probably ever will know. It is worn comfortably about the waist all night and every night for two or three months. Thus while you are sleeping it sends a great, soft, potent, life-giving current of VITAL FORCE into your blood, your nerves and your organs. There is not a moment's wait. It helps you immediately; it commences from the first time worn, to show you the sunshine of new energy; it takes the kink out of your back in one night; it makes a man of you after you have given up in despair, simply because it supplies you with VITAL POWER—which means health. Just stop to think. You have the same organs, nerves and fibre, the same make-up exactly that healthy, vigorous men possess, the only difference being you are under tone; you need a foundation of NEW VITAL RESERVE, and it is this I give you. There is no reason why you should not be as strong, healthy and vigorous as the best fullest-blooded man of your acquaintance. The matter is easy if you do your part. Never mind about buying a HEALTH BELT as yet; first get in communication with me; read over my booklet, and if you want to do so tell me your physical ailments that I may advise you; then a little later we can arrange in some way for you to try my HEALTH BELT. But first fill in the coupon and get the book free, or call at my office. My HEALTH BELT also cures Rheumatism, Kidney, Liver and Stomach disorders.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call. Consultation Hours, 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free, sealed

THE HORSE.

The Care of Weanlings.

To some, advice on this head, is of course, superfluous, but others, less experienced, may be glad of a few hints as to the most approved methods of starting the youngster on an independent career. In the first place, be certain that your foal is old enough to wean, that he is in fair condition, thriving and healthy, that he knows what grain is and what it is for, and that, should you have any cows milk to spare, he will not be above drinking it. As to age, no colt should, if at all possible, be permanently separated from his dam until he is at least four months old, while another month, or even two by her side will make him a better horse and lessen considerably the risks of his first winter. Many farmers, however, who are trying to raise colts can ill afford to let their mares suckle so long, and while it might, in many cases, be more profitable for snch men to refrain from breeding altogether, the fact remains that they must use the mares on the farm, and the foals have to suffer accordingly.

It is a good plan to teach the foal to eat out of the same box as his dam, and it is astonishing how little tuition, even with very young colts is necessary when the food is placed within easy reach. For some time also before the foal is actually weaned he should be schooled to drink milk, if there is milk to be had, and it is well to remember in this connection that milk drinking is an accomplishment of no little value for any horse to acquire, nothing being more advantageous to an animal suffering from any febrile or delibitating disease, than the voluntary absorption of milk in lieu of other fluid when the appetite for solids is capricious, or altogether lost. As regards the diet best suited for young foals, many different opinions are promulgated, but in the experience of the writer nothing is equal to good sound oats with a moderate admixture of bran twice a day, and a well scalded, not too bulky, mash of the same materials, seasoned with a tablespoonful of salt, and perhaps a handful of crushed oil cake for the evening meal. Many recommend crushed oats, but repeated trials have convinced the most successful breeders that whole oats are more nutritious, and if properly masticated, as they generally are when fed with dry bran, more easily digested than chopped feed of any kink.

Colts should be halter broken and taught to lead while yet with the dam, as this renders them much more tractable and easily controlled during the excitement inseparable from weaning, and also facilitates housing when the accommodation is limited, and there are several to be kept together. Loose boxes are preferable to ordinary stalls for young stock, but provided the stable is clean, airy and well lighted it will do no harm to have them tied at night, taking it for granted that they enjoy for the greater part of every day the freedom of a roomy, and in winter, well sheltered yard. This latter point is of very great importance. Your youngster must have a chance to develop bone and muscle, and in no other way than by lots of exercise can he be reasonably expected to properly assimilate the generous diet recommended above, while despite all old-fashioned ideas to the contrary, without a liberal grain allowance he will not likely be much to look at when the sun begins to melt the snow in the spring. When two or more colts are kept together it is better to have them separated at feeding times, or the strongest of the lot will be apt to wax fat at the expense of his weaker or less voracious companions, many backward colts being literally starved by careless neglect of this simple precautionary measure.

Weanlings are frequently troubled to a considerable extent with intestinal worms of various kinds, especially if grazed on low lying pastures in late summer or early fall. Some of these parasites are more to be dreaded than others, but none of them are desirable guests or in any way beneficial to their involuntary hosts, and it is therefore advisable to take measures for their removal. The old farmer's remedy of wood ashes and salt is not to be laughed at in this connection, and if persevered with in small doses for some time will often have the desired effect, but where a more speedy and certain riddance is desired it is well to give a course of anthelmintic powders, as iron sulphate 1 drachm or powdered arecanut 2 or 3 drachms twice a day in a little soft food for a week, to be followed by a drench composed of turpentine 1 oz., and raw linseed oil from 10 oz. to a pint, according to the size and condition of the patient. This mixture should be given on an empty stomach and all dry food withheld until the bowels have responded to its action. In all cases of intestinal worms, benefit is found from occasional injections of tepid water strongly impregnated with soap, and for this purpose Gamgee's enema funnel, a cheap and convenient instrument easily turned out by any tinsmith, will be found suitable. Some varieties of worms demand for their successful removal a repetition of the medicinal treatment but those most commonly met are generally satisfactorily disposed of at the first attempt.

External parasites should also be guarded against. Many a good colt has gone to skin and bone from the constant irritation and uneasiness produced by lice, and whenever a young animal shows unaccountable loss of condition and want of thrift it is advisable to examine him closely for signs of the presence of these undisirable companions. Should they be detected, the sufferer may in reasonably mild weather be washed well with carbolic soap and soft warm water, and after thoroughly drying the skin, carefully and closely dressed, more particularly about the roots of the mane, with a good insecticide. For the purpose an ointment composed of equal parts by weight of sulphur and lard will be found effectual, as also safe, cheap and easily procured. In cold weather the washing must of course be dispensed with, but the ointment may be applied without risk in a moderately warm stable at any season of the year.

When colts are debarred from taking much outdoor exercise their hoofs very soon become deformed, and great harm is often done to the bony and tendonous structures of the limbs from neglect to properly trim and regulate the growth of the horny coverings of the feet. Accidents of various kinds are liable to occur, and in all such cases the advantage of having the patients halter broken, thoroughly domesticated and free from fear of their human friends if incalculable. This state of affairs can only be brought about by the most careful, systematic and painstaking handling of the young animals ,rom the time they are foaled, but more especially during the first week or two after weaning.—J. G. Rutherford, C. M. G.

Barren mares are one of the worst menaces the horse industry has to fight against. Not only do the mares refuse to get with foal, even when bred a dozen times a season, but they effect other mares bred to the same stallions. Breeders are unanimous on this point and many are refusing to allow their stallions to serve mares that are known to be barren. A sterile mare spreads her sterility, making her a menace to the community in which she is owned. Recently a healthy mare was used in a demonstration to prove this theory. Germs were injected into her uterus on February 9 and she was killed and the parts carefully dissected on February 16. In this short period a remarkably diseased condttion of her uturus had developed.

Some Hints on Shoeing.

The management of horses' feet with the object of keeping them strong and healthy, is most important and demands the constant attention of every horseman. The following rules should therefore be strictly observed if horses are to be kept free from lameness and remain serviceable to a good old age; so far as shoeing is concerned:

1. Horses should be newly shod, or the old shoes removed and replaced, at least once a month.

2- When being shod the hoofs should be reduced to a proper length and evenly leveled, so that the toe will not be too long, nor one side higher than the other.

3. The frog and sole should not be pared, interference with them being limited to the removal of any loose portions.

4. The shoe should not be heavier than is necessary to withstand wear for a certain period—say a month.

5. The shoes should be made to fit the hoof—that is, be the full size of the circumference of the latter.

6. The shoe should be attached to the hoof with as small and as few nails as may be necessary to keep it securely on the hoof.

7. The nails should not be driven higher in the hoof than is needed to obtain a firm and sound hold.

8. When the shoe is nailed on and the clenches laid down, the front of the wall should not be rasped, but left with its natural polish, and in all its strength.

9. If possible the frog should be allowed to come in contact with the ground.—By Dr. George Fleming. C.B., F.R.C.V.S.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'SCONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevets the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:
SPLINTS
CURBS
SPAVINS
ENLARGEMENTS
COUGHS
COLDS
DISTEMPER
GLANDERS
FOUNDRES

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,

RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman).

Regularity

of the bowels is an absolute necessity for good health. Unless the waste matter from the food which collects there is got rid of at least once a day, it decays and poisons the whole body, causing biliousness, indigestion and sick headaches. Salts and other harsh mineral purgatives irritate the delicate lining of the bowels. Dr. Morse's Indian Root Pills—entirely vegetable—regulate the bowels effectively without weakening, sickening or griping. Use

POULTRY.

Parasites of the Poultry Run.

One of the most remarkable features of poultry-keeping lies in the fact that certain birds "go wrong" without any apparent cause. They are obviously ill at ease, sickly looking, or positively suffering. The food is changed with a view to restoring the birds to good condition and sound health, but the experiment fails to have the desired effect. A fresh roost or run is chosen, the company of fresh birds is tried; but all these attempts at betterment prove a mixed blessing, and we wonder what has gone amiss.

STALKING PESTS THE REAL CAUSE.

The real cause of the mischief has, unfortunately, been overlooked. The birdis the victim of a host of parasites, which neither good food nor fresh runs will eradicate. They cling to their host with the tenacity of a viper, and the poor bird carries them with every step. Just turn back the quills gently, keep the warm hand hidden for a moment, and the secret will be revealed. A small colony of parasites will jump from their lair, and spot the hand of the disturber. The significant growth of parasitism in poultry has come more acutely into prominence among breeders and fanciers. It is perfectly useless to close one's eyes to the fact that pests in the roost are the most dangerous enemies which fowls have to encounter. They are numberless; their vicious habits know no mercy nor quarter; some attack by day, others by night, while others are continually preying on some part of the bird's skin and quills. If fowls are to be healthy, robust and in the "pink" of condition they must be kept free from parasites, for when once these pests take possession of the epidermis of a bird it may be swarming within a fortnight.

FLEAS WHICH STICK TO THE FOWL.

Perhaps the most tantalising and bloodthirsty of these parasites is the hen flea. His chosen host is the fowl. He is well known for his peregrinations among the feathers, where he hides foxily from the possible nips of the bird's beak, and at the opportune moment makes a painful plunge into the bird's flesh, drawing his drop of blood at every dart. Happily these parasites are "partial" only. They flee from the light of day; the airy fields and meadows, the cheery sunshine have no attractiveness for fleas. Their abode is in the dark. So when the birds leave their perches with the rising sun the pests retire with the darkness, and find their way into the nests, crevices or niches of the roost. The hen flea is quite distinct in the pulex family, and is somewhat dissimilar in appearance and habit from the other fourteen fleas which form our English species. He sports a fine array of barbs—twenty-six of them—on the first segment of the pro-thorax, so that we need have little difficulty in tracing him.

WHERE THE NITS ARE LAID.

If we can discover the "nits"—those pearly white specks which are the ova of the flea—we have a clue to the extinction of the pest. These are not discoverable among the bird's feathers; but in the lower parts of the nest, which in some roosts is not renewed for weeks together we should find a veritable multitude all clinging to a filmy network of hazy webbing, interwined among the dry wisps of hay and straw. This is the breeding ground of the fleas. Here they form their nidus during the day, and scour forth for food among the fowls at night. The nits hatch in ten days, and the larval fleas begin their out let or hindrance as she takes to her nest for laying. In two or three weeks the larvae crawl to the nearest crevice, spin a silken cocoon, and lapse into the pupal stage. Twelve more days pass when the fully-formed insects, with stumpy wings, legs, eyes and antennae, cut away the webbing and begin their depredations. Hen fleas are continually reproducing their kind throughout the year. They are most prolific in the warm days of summer, when their multiplication is amazing.

THE PLAGUE OF MALLOPHAGANS.

These are true insects, which prey incessantly on the birds; night nor day allows of any intermission. Bird lice (mallophaga) bear little or no resemblance to their human congeners. Human lice pierce their victims with a plunging dart; bird lice have heads provided with biting and chewing organs. How formidable are their jaws! What terrible havoc they must create among the tender growing parts of the quills of young pullets and chicks! See the rough-nibbled edges of feathers near the skin of the bird where these mallophagans have been at work. They are born biters; they have no metamorphoses from egg to larva, pupa and imago, like fleas. They begin life as true lice and end it as such. On English fowls there are eight different species, and each selects its particular bird. A hen-louce will not live on a duck; a guinea-fowl-louse will not thrive on a peacock. Besides, different species of lice will cling to different areas on the same bird. Some colonise only among the wing feathers, while others infest the neck and head only.

MALLOPHAGANS UNDER THE MICROSCOPE.

These animals are so infinitesimal that the unaided eye sees them only as mere specks. Their implements of torture are completely hidden from view. To discover how and why they attack the choicest treasures of the poultry run we must submit them to the objective of a microscope of medium power. The revelation will solve the mystery of sickly-looking fowls. We then wonder how birds can appear even moderately healthy with these gnawing at their vitals. Truly the study and investigation of these parasites, which literally swarm in some roosts, is of profound import to all lovers of fine birds.

Just look at a few of these warriors. The Goniode is a dull, brownish individual, with dark markings across his body, which separate him from all other mallophagans. His head is an awesome mixture of hooks, teeth and jaws, which must seriously affect the life of any bird. These pests make their home about the rump and straggle occasionally about the larger wing feathers. Goniocotes are smaller in size, but are more prolific than goniodes. A hand inserted among the finer feathers of the rump and back will draw a dozen at least if they are present at all. They are of dirty-brown aspect, with shadowy lines on the body. The Docophorus boasts a powerful head, two glaring eyes, and fierce claws which cling to the quills while the louse masticates his food. The Lipeurus differs from the former very materially. He has a slim, narrow body, with brown bands and spots. His head is less formidable, and he does much less damage to the birds. His mouth is rounded off with a neat fringe, which enables him to hold aloof the fine downy hairs while he nibbles at the skin of his host. The Lipeurus is widely distributed among fowls, and lives generally among the wing quills. The Menopon louse is a lithe, wary creature, and although numerous on all infested birds is not easily captured. He flits about among the feathers with remarkable agility, seldom remaining in one position for a single minute. The Menopon is found on fowls, turkeys, geese and pigeons.

HOW TO PREVENT AND CURE.

Parasites on poultry are much easier to prevent than to cure. Hence vigorous efforts should be made to check them at the very threshold of the run. The all-important items in poultry keeping are systematised cleanliness, frequent limewashing, and prompt removal of refuse. Pests live and multiply enormously in dirty roosts. Their partiality is for dirt, gloom and insanitary surroundings. Ceilings, walls, floor, perches and nest-boxes should be limewashed not once merely, but several times a year a little paraffin and soft soap being mixed with the wash. All crevices, corners and joints should be deluged with wash. Suitable and sufficient dust-baths are indispensable; good road dust, with a generous sprinkling of sulphur and lime, is admirable for the purpise. Creosoted sand and ashes are also suitable as preventives.

Where birds are already attacked they should be set apart for individual treatment. White precipitate (ammoniated mercury) is used, but owing to its poisonous properties caution is necessary in applying it as a liniment to the affected parts. A bath of elder-flowers and soft soap is also effective in clearing all parasites; this bath does not in any way damage the plumage.—J. H. Crabtree in Farm and Home.

Effect of Corn on Color of Egg Yolks.

The Maryland station recently concluded experiments to determine the effect of corn on the color of the yolk of eggs. A flock of 120 Single Comb White Leghorns were divided into three lots of 40 each and were housed and cared for alike except that one pen received its whole grain in the form of corn; another in the form of wheat, and the third received a mixture of corn and wheat. All pens were allowed free access to narrow yards which furnished a very limited amount of green stuff. All the eggs laid by these pens were saved and, after boiling, were cut in half and placed in parallel rows for comharison. In every instance the eggs from the corn-fed lot showed yolks with a deep yellow color. Every egg from the corn-and-wheat-fed lot had a yolk of a good yellow color, while with but three exceptions the eggs from those fed wheat had yolks of a very pale yellow color. The three exceptions can probably be accounted for by some of the hens getting green food from the yards. Another test was made subsequently with white corn and the yolks were a very pale yellow.

As a result of the tests it was concluded that yellow corn, when fed to hens in the proportion of 9 parts corn to 12 parts mash, gives a very deep yellow color to the yolk. Yellow corn, when fed to hens in the proportion of 4 1-2 parts corn to 16 1-2 parts other foods, gives a noticeable yellow tint. Wheat, when fed in the same proportions, does not give any yellow color to the eggs; and white corn is no better than wheat, so far as furnishing a tint to the yolk is concerned.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

When We Teach the Child.

"I see in every child the possibility of a perfect man."

What do we do when we teach the child?
We put a thought that is sweet and mild
Into a mind that is waiting for seed,
Into a heart that has never felt greed.
The man with such thoughts is never beguiled,
For we teach the man when we teach the child.

What do we do when we teach the child?
We take the treasures which may be pil'd
In lesson or poem or Nature's store,
And transform them all into golden ore
Of character, which cannot be revil'd;
The strong man comes from the well-taught child.

What do we do when we teach the child?
We take the nature, untam'd and wild,
And mold it into a life serene,
With heart and will and judgment clean.
We make the man who is undefil'd
When we teach, as we ought, the child.

What do we do when we teach the child?
We plant the truth, where the Undefil'd,
Our Lord and Master, said freedom makes.
Thru knowledge, true freedom comes and takes
Its place, and dominates passion wild;
We've saved the man, when we've saved the child.—Friedrich Froebel in the Glenwood Boy.

The Prisoner of Baalbek.

Grant had suddenly displayed an unexpected zest for bargaining. The cause of his former silence was the Syrian fever, induced partly by an intemperate use of Turkish Delight, his favorite sweetmeat; and until we crossed the Lebanons my companion had denied himself the Eastern relaxation of beating down the Turk. Perhaps the whiffs of winter had revived him, and the unwonted grandeur of the ascent past Brummana into the highlands, where the rivers of Syria had their snowy homes, and where cedars grew.

The railway journey from Beirut was the slowest on record, 16 miles in four hours; but no lover of the beautiful could complain that it was too slow. The mosques and the American college, the trees and white houses, the ill-fated quarantine ground, all stood out in the earlier ascent. On the more elevated hillside a mingling of greens added to the scenery. The darker hue of the flat-roofed mulberry, whose leaf, changed into silk, would ere long adorn some Parisian beauty, vied with the light green of the grapevine whose juices would fire the wit of that Parisian's courtier; and these greens with the red tiles of the houses gave colour to the landscape.

As we passed out of the realm of human labors into the abode of Nature's bolder work, a whirlpool of mountain peaks seemed to be encircling us. Deep scars were visible on the lofty rock walls. Sudden droppings of prepices, and the empty spaces of former hills, suggested the battle scenes that Milton dreamt of, when Satan waged his war on Heaven and

"Sidelong pushed a mountain from his seat."

Emerging upon the open again, we beheld far below us the clearly traced shore line, and the blue of the Mediterranean, whose waters to the further west were lost in the haze of the sky, and joining the vault of heaven seemed to rise up to the atmosphere we breathed, which now was crisp and keen, cooled over these eternal snows.

All this revived Grant, so that when we arrived at El-Ma'allaka he was a new man. There was much noise and movement about the station, which was filled with passengers to and from Damascus, while a few, like ourselves, were waiting to go by carriage to the famous ruins of the temple of Baalbek. The table was a credit to the station-mistress. Among those who enjoyed the meal were several of the normal types of tourists, a captain of the Turkish infantry whose pock-marked face was marvellously illuminated when he mentioned the beauty of his native Damascus, and a youth from Jerusalem who had donned all of the costume of the West, some of its language and very little of its courtesy. His familiarity was preparing him for a fall.

During the service of dried figs, more like the "naughty figs" of Jeremiah than to our taste, Grant slipped out unnoticed to interview the liverymen in the yard; and such was his success that on my appearance the platform was the centre of what in our undemonstrative West would be called a riot. There was evidently an uprising of charioteers.

"Only ten francs to the Temple." This was the sentence which rose shrill and clear above the hubbub of sounds; and at its delivery a fresh outbreak of voices, cracking of whips, and wild gestures. The usual price, including the return journey, was twenty francs for each person; and the guild of unsuccessiul applicants was indignant.

But Grant was calm: his triumph was kingly. The fever had departed. He was tasting a new kind of "Turkish Delight."

True, our carriage was not of the best, and jolted as if quite conscious of the bargain; the horses seemed to catch the spirit of the carriage, while the driver would stop every now and then to take in some straggler by the way, pleading as his excuse that each was his brother. However, we arrived early in the afternoon in time to visit the Temple, and with the pleasurable knowledge that it was the cheapest trip of the journey.

In a few hours we had finished our inspection and had turned to the hotel on the eastern slope, discussing as we went the labor involved in the quarrying and moving of the giant stones, and that labor now a waste, a haunt for the antiquary to sport in

While we talked of the temple ruins a women came towards us, tall and bold of form, with the customary looseness of atire and a shawl on her head. The sun shone dark on her burnished face, the same light which farther west was coloring the snows of the Lebanon with a rosy hue. The face was uncommon for the East; the hair and eyes were fair, and a flush passed up and down the cheek. As we waited for the inevitable "Backshish," a voice spoke in purest English: "You look at ruined temples, but there are more ruins here than the temple of the Sun." The eye flahed, and the words were fierce, only as they died away the fierceness gave place to a deep sadness, as when the infant's petulant cry of anger tones off into the low wail of one broken-hearted.

"How do you speak English so well?"

"It had been well for me had I known no other tongue."

"You speak in mystery."

"It is no mystery to me, but only misery."

"What troubles you, good women?"

She waited, scanned our faces and, as if satisfied, made answer:

"Will you listen if I tell my story? It can be of no avail—I must remain; but the telling of it will relieve me; and when you hear it you will know that there are other broken things in Baalbek besides the fallen pillars."

"We will gladly hear you, and help you also if we can." So Grant encouraged her; for he was kind and easily moved to pity. The following was her tale:

"I spent my childhood in the Province of Nova Scotia, on a farm remote from the sound of railroad, and far from any meeting-house or village. My parents had migrated from Scotland and, being too poor to buy a farm, had gone inland to cut out a home from the native wilderness. After devoting every moment to their toil they earned the reward which honest effort seldom fails to receive, so that in my time the landscape had been transformed. My father had made all the improvements himself, following the method of home production. The wooden cottage was built from our own trees and, though there were some faults in the sills, these were concealed in winter by the annual banking of the tan bark, while in summer my mother planted along the edge her flowers, of which she loved most of all the lupins and the bleeding-heart. I used to pick these to pieces and wonder if hearts could really bleed. The fields of grain and grass, alternating with crops of roots, were my father's pride, and he would tell of the cartloads of stones which had gone to make the farm the richer, and which were now used for the front wall along the roadside. He had cleared, burnt and stumped every acre of the fair hillside. And it was an object worthy of his joy, though the world has scant admiration for the heroes of the soil who recover the forests and drain the swamps.

"But success had claimed its wage, and, by degrees, work, like a slavemaster, had bound him over by a fast contract. The struggle was impressed on him and my mother, even as on yonder stones of the temple you watched the chisel marks of the past. Sometimes they would rebel against their fate, but their protest was in vain, so that when years brought affluence and a prospect of lessening the tension, the time for such relief was ever postponed. My mother was not of the ordinary type, being the supplement rather than the complement of my father. She had not limited her efforts to the female duties of the farm, and the chores about the yard, but had loved to work in the woods and the fields. They were both chips of some harder block, and the stream of a common work had worn them into one shape.

"They treated me as a member of another state from theirs. My girlhood was passed in ease, free from the incessant toil which followed them. Every stone they lifted from my path; and, while in my heart I knew that their care for me was a labor of love, yet my rebellious nature would whisper that all was due to their love of labour. My parents had given me leisure, but had not furnished me with the social necessities of leisure, so that I was a creature living without an atmosphere. My world was uninhabited. I was a foreigner at home. They gave me all that care could give; they could not give me companionship. They were prisoners of labour, and I was a flippant child of ease; and we passed our lives in closest separation. Most of all it was tedious in the long winter, when the snow came in November and blocked the road, while it was well on in May ere the frost had heaved out of our salty soil. Mails were irregular; visitors were very rare. I chafed against my lot. I only faintly perceived their love. I rebelled against their labour."

A pause came in the story, as she looked at the distant hilltop, and then continued:

"Into that silent anarchy of our home an agitator came. I can remember so well watching him as he climbed the road. His figure was unusual and could not be mistaken. The stalwart form only partially concealed the traits of his class, for the swing from side to side, and the stoop of the head revealed him to be one of those pedlars who crowd our Province in such numbers. His manner was as striking as his form. A soft accent and pleasant smile put him at once on good terms with his company.

"He came with our December storm and that winter it was impossible to

FREE ADVICE TO SICK WOMEN

Thousands Have Been Helped By Common Sense Suggestions.

Women suffering from any form of female ills are invited to communicate promptly with the woman's private correspondence department of the Lydia E. Pinkham Medicine Co., Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence. A woman can freely talk of her private illness to a woman; thus has been established a confidential correspondence which has extended over many years and which has never been broken. Never have they published a testimonial or used a letter without the written consent of the writer, and never has the Company allowed these confidential letters to get out of their possession, as the hundreds of thousands of them in their files will attest.

Out of the vast volume of experience which they have to draw from, it is more than possible that they possess the very knowledge needed in your case. Nothing is asked in return except your good will, and their advice has helped thousands. Surely any woman, rich or poor, should be glad to take advantage of this generous offer of assistance. Address Lydia E. Pinkham Medicine Co., (confidential) Lynn, Mass.

Every woman ought to have Lydia E. Pinkham's 80-page Text Book. It is not a book for general distribution, as it is too expensive. It is free and only obtainable by mail. Write for it today.

CHALLENGE BRAND WATERPROOF COLLARS

Look like linen—feel like linen, but outwear a dozen linen collars. No laundry bills—a little soap and water only required to keep them fresh and clean.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

Dysentery is always serious and often a dangerous disease, but it can be cured. Chamberlain's Colic, Cholera and Diarrhoea Remedy has cured it even when malignant and epidemic. For sale by all dealers.

move for many days; and into our snowbound home he brought great pleasure. He told of the romances of the Middle Sea, of the thrilling tales of Druse and Meronite; of the beauty of Damascus, the river Barada and the slopes of the Lebanon. He stirred my mind with the Scripture prophecies of the time when the nations of the earth would return to the land of promise at the second advent of the Saviour to this world. He told of a large estate of his family near Baalbek, into which he would enter when his father, now aged, had passed away. He told me of more than one "Temple of the Sun." Thus he gave me my atmosphere; peopled my silent world. He entered my realm and became my king. Enough to say that ere the last snows fell that winter we were married, and escaped together to our "Promised Land."

Another furtive glance our her shoulder, and she read our thought, "What of your farm and heritage?"

"Yonder is my home;" and she pointed to a field of several acres on the distant hilltop, where slight patches of green were visible. "That is our farm. I am its keeper. Within the room he dwells who brought me; and our heritage is all but gone. He is a lover of indolence and I am the reluctant slave of labour. Often do I wonder at my parents, and at the irony of events that I should by force be driven to their calling. I I have so often asked if there is not something in the blood that has transmitted it. Doth fate ever follow people thus? So still I rail at work; and when I think of the curse of the land I wonder what murder I am guilty of. Is it my parentts' character that I have killed?"

When she stopped Grant questioned her as to her return home.

"Who can escape the passport system of this land of captivity? Besides, he watches and will soon call for me. I go back to my lot; and of late I have been regarding it a little more kindly. I recall the glow that would brighten my mother's brow when a day's work was accomplished, and my revolt passes into submission. I begin to feel that I am more their child than formerly. Their spirit, though late, is passing into me. And amid it all I remember the words of a perfect child who was one with His Father, and who said, "My Father worketh hitherto and I work.' I think, too, of the motto that hung over our mantelpiece at home: "Man goeth forth unto his work and to his labour until the evening." Then I cease my flippant ways and check my complaint."

The shrill voice of a man cried out: "Marie," and with no farewell she had gone. The sun began to set; the Lebanons, that were so rough in daytime passed through that wondrous range of colours that repeats itself each evening in the East, and the ruins of the temple seemed to hear the old sun god, and the six pillars stood out as if no destruction had ever entered, while a ray of gold followed the women as she hurried off.

In the morning early our coachman called and asked the prepayment of the fare, that he might settle with the innkeeper. We gave him the stipulated ten franc piece. He took it and chuckled, and said he would not drive us back to the railway until we paid another

"It only meant one way."—Jas. W. Falconer in the Canadian Magazine.

More Prize Money at the St. John Exhibition.

Copies of the Greater St. John Exhibition Prize Lists are now in circulation and an examination of the various rules and prizes show that the Committee in charge this year have made some radical changes and tried to meet where possible the question of the exhibitors.

In the Horse Department the most material change seems to be in the rule where permission is now given to one animal to enter in one or more classes, as is the custom in the Winter Fair at Amherst. This not only gives the individual exhibitors a better chance to reap more prize money and so meet their expenses, but by increasing the entries in each section adds very largely to the interest of the spectators and those generally who attend the Fair.

In the Cattle Department a radical change is introduced in the form of a graduated Prize List as applied to the dairy breeds. Three separate Prize Lists are printed, one applicable if the entry, that is the actual exhibit, number less than sixty; another applicable if the exhibit numbers sixty, but not over eighty; but still the third applicable if the exhibit exceeds eighty in number. By the use of this graduated Prize List the Committee hope to meet the objection and where the competition is strongest, there the money should be devoted as the standard of excellence required to win will be certainly higher than in a class where competition is light; this should also tend as an incentive to the various breeders to get their brother breeders in line, so as to increase competition and thus qualify for the larger Prize List.

The Sheep section presents no radical changes, but the prize money is kept on the same basis as during the Dominion Exhibition and there has been no revision to the money originally prevailing there at previous Provincial exhibits. To this extent the Association are co-operating in the present movement to encourage sheep raising in the Maritime Provinces.

In the Swine Department we see a large increase in prize money, the amount devoted to each class being in excess even to that of the Dominion Fair; this we feel is a change in the right direction as the cost of exhibiting swine is quite large and some return should be made to the breeders to offset their trouble and expense.

In the Poultry Departement the same general classification was maintained as at the Dominion Fair in 1910, whereas in the pens of the poultry many increased classes may be found.

The balance of the Prize List appears to adhere quite closely to lines of former years, with perhaps a slight increase in prize money noticeable throughout the whole list, that is not necessarily over the 1910 figures, but over those which ruled in 1907 and years previous to the Dominion Exhibition. In the Apiary Department there is a good list of special prizes given by different people, which should tend to bring out a good exhibit in this class which has always been more or less weak in our local shows.

In a general way, the Greater St. John Exhibition from August 31st. to September 7th., bears every indication at the present time of proving a remarkable success. The magnificent new equipments of buildings erected in 1910 for the Dominion Exhibition, is an advantage of inestimable value, and the flood of lime light which has been focused upon the city during the past year, because of its great transportation prospects, has induced a large number of entries that is far in advance of other years at this time.

The entertainment features, upon which after all, the holiday-making success of an exhibition depends, are this year of an especially fine quality. They will include two aeroplane flight daily, by the noted French aviator Emil Metach; two daily concerts in the main building by Signor Jovine's renowned Neapolotan troubadours, a party of thirty instrumentalists, singers and dancers; the renowned Takezawa Imperial Japanese Troupe of balancers, jugglers, acrobats and black art workers; the Ernst Trio of German knockabout comedians; some thrilling animal acts; the magnificent fireworks spectacle, "The Bombardment of Tripoli," a bigger pike than ever, two vaudeville theatres, band concerts, etc.

Among the industrial exhibits, there will be some notable displays of manufactures in motion, in Machinery Hall. The motor show, the food show, Women's Department, art gallery, etc., will be along the lines of the big Dominion Exhibition.

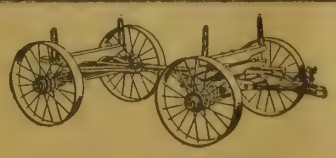
SUFFERED WITH LAME BACK

WAS NOT ABLE TO STRAIGHTEN UP

Mr. C. Grace, Hamilton, Ont., writes: "I was suffering with lame back, and for two weeks was not able to straighten up to walk, and hardly able to sit down for the pains in my back, hips and legs. I had used different kinds of pills, plasters, liniments and medicines, without any relief. One day there was a B.B.B. book left at our door, and I read about Doan's Kidney Pills, and I decided to try them. Before I had half a box used I felt a great deal better, and by the time I had used two boxes I was cured. I have no hesitation in recommending Doan's Kidney Pills to all suffering as I did, or from any illness arising from diseased kidneys.

Price 50 cents per box, or 3 boxes for $1.25, at all dealers, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct, specify "Doan's."



BUY A WAGON YOU CAN DEPEND ON

For convenience, strength and durability, get a T-A Handy Farm Wagon. Designed especially for farm work, will give everlasting service under the roughest usage to which a wagon can be put. And besides—it is easy on horses.

T-A Handy Farm Wagons and Wide-Tire Steel Wheels

Carefully and strongly built of the highest grade material, these T-A Wide-Tire Steel Wheels will carry 25 to 50 per cent. heavier loads without the least danger of breaking down or getting stuck.

We will be pleased to send you descriptive catalogue. Write for it.

Flour and Breadmaking.

(Continued from last issue.)

MILLING OF FLOUR.

The roller proress of making flour is a gradual one. In the old days, when all the flour was ground by the stone process, the whole of the flour was left in one grade, and the germ and some of the bran layers of the wheat were not removed in the bolting process. The conshmers' demand for a whiter flour than could be made by this process was partly instrumental in bringing in the roller process of milling, although the introduction of harder varieties of wheat, closer milling, and the division of flour into a number of grades were some of the other reasons for its introduction.

By the roller hrocess the miller has it in his power to separate the flour into as many grades as he chooses, and in the larger mills as many as six grades of flour are made from one stream of wheat. The process is, briefly, as follows:

After being thoroughly winnowed and scoured, the wheat is passed between a pair of corrugated rollers, revolving towards one another, but one travelling slower than the other. In this first "break" the wheat is simply broken open along the crease; the whole of the broken-up material is then separated according to fineness into a number of products. The coarse, main part of the grain is returned to another pair of corrugated rolls, and is ground a little closer; the product is again sifted and the branny part returned to other rolls. This is repeated a fourth, fifth, or even a sixth time, or until practically all the starchy materials are removed from the flat particles of bran. With each sifting some material fine enough for flour is obtained, but the greater part of the endosperm, or central part of the wheat, is left in a coarse, granular condition, which, when purified, forms the wheat farinas that are sold as breakfast foods under a great number of fanciful names, such as Meat of Wheat, Hearts of Wheat, Wheat Crystals, etc. It is from this same part of the wheat that the whitest and strongest flours are made. The germ is the richest part of the grain in protein and fat; the inner bran layers are the next richest, and the starchy endosperm contains the least of these constituents. It naturally follows that if flour is made from the endosperm it will be whiter, and lower in protein, fat, and crude fibre than if the whole grain was included, or somewhat poorer than if all the flour made from the wheat was left in one grade, as was done in the old stone process, or as is done to-day in making a straight-grade flour.

The names assigned to the various grades of flour are very numerous, as practically every flour miller has special names for his products. But, while there are a number of variations, nearly all flour may be graded as "patent," "bakers'," or "straight." The well known flours, Royal Household, Five Roses, and Purity, are patents which probably form about 35 per cent. of the total flour. Sometimes, however, the term "standard patent" or "long patent" is used to designate a flour which forms about 90 to 95 per cent. of the total flour, and is, consequently, only a little better than a "straight." The "bakers'" grade, o r "clears," usually represents about 55 per cent. of the flour after the patents have been taken off. A good bakers' grade of flour will yield about as much bread as a "patent," but the bread is not of so good a colour. The low grade is got by grinding still closer to the bran leaves, and represents the remainder of the flour, or about 10 to 15 per cent. of a total flour. The "straight" grade is the whole of 100 per cent., of the flour from the wheat left in one grade. Of course, the per centage amount of the flour left in the various grades are not fixed, but are varied by every miller, according to the quality of the wheat he is using and the strength and colour of the flour he wishes to produce.

To show the difference in the composition of these different grades of flour the following figures, taken from Bulletin No. 13, part 9, of the Bureau of Chemestry, Department of Agriculture, Washington, are given:

PERCENTAGE COMPOSITION OF WHEAT AND THREE GRADES OF FLOUR MADE FROM IT.

	Moisture	Fat	Carbo-hydrates	C. Fibre	Ash	Proteids	Gluten	
							Wet	Dry
Wheat	9.07	2.74	70.37	1.68	1.79	14.35	32.31	11.88
Patent	11.48	1.45	73.55	.18	.39	12.95	36.14	10.85
Bakers'	12.18	2.00	69.99	.33	.62	14.88	51.21	16.97
Low grade	12.01	3.86	63.26	.93	1.99	17.95	10.01	4.26

It will be noticed that the low-grade flour contains the most fat, fibre, ash, and proteids, and the least starch and gluten, while the patent flour has the least of the first four named constituents—in every case very much less than the wheat from which it was prepared—and the largest percentage amounts of carbohydrates, or starchy material, and a much larger quantity of gluten, although not so much as the bakers' grade. When we remember that there is more fat, ash, fibre, and proteids in the bran layers than in the endosperm, and that the patent flour is kept as clear as possible of bran particles, we are not surprised that this flour is low in these materials and that it is particularly rich in starch. Because of these facts it is lighter in colour than the other grades; and, because consumers of bread attach so much importance to this question of colour, the patent flours sell for more money than any of the other grades; while, judging by percentage composition, the low grade would appear to be the most nutritious, although, as we shall see later, this does not necessarily follow.

The above named grades of flour are generally made from the hard Western wheats. The softer Ontario wheat may also be separated into as many grades, but it is more commonly sold as a "straight" grade flour, or as a long patent, i. e., a straight grade flour from which 5, 10, or 15 per cent. of low-grade flour has been removed. As shown earlier, the soft winter wheats contain less protein and more starch than the spring varieties; consequently, as gluten is a part of the proteins, the flours will be lower in gluten. They will also be more starchy, and are generally whiter in colour; these flours are usually sold as pastry flours. Although good bread can be made from them, it is not so suitable for commercial breadmaking as the stronger spring wheat flour. It is generally thought that the soft flours make a sweeter and more palatable loaf of bread, but it will not produce so much, nor will it make so large a loaf, as the stronger flour. Many millers in Ontario make a blended flour, in which there is 30 or 40 per cent. of spring wheat and the balance made up of winter wheat. Most of the bakers use large quantities of the soft flour; but, usually, they prefer to do their own blending, because the two flours do not "work" evenly in the breadmaking process.

There are other grades of flour on the market. Among these possibly the Graham is the most important. This flour, if true to name, should be the whole wheat, ground fine, without no bolting process. Therefore, it should be of the same composition as the wheat from which it is prepared. It is to be feared that very often the material sold for Graham flour does not come up to this standard. Entire-wheat flour is not used to any great extent in this country. In preparing it the outer bran layers are practically peeled off by machinery, and then the remainder of the wheat is reduced to flour.

Gluten flour is a special brand prepared for people troubled with diabetes, or others who cannot use starchy foods.

(Continued in next Issue.)

Household Hints.

Add a little boiling water to an omelet to keep it from being tough.

If you grease the inner rim of a kettle its contents will never boil over.

If you find the oven too hot and your cake commencing to burn, set a pan of cold water in the oven.

Never fold a fur-lined garment when putting it away for the summer. Put around it a large cloth lined with newspapers and hang it up.

Keep your spices in glass bottles with screw tops—such as peanut-butter jars. A glance will tell you the contents, even if marked covers did get miffed.

As a substitute for hot-water bags, use common flannel bags made in convenient sizes, with drawstrings. Fill them with hot sand or salt; keep a half-dozen ready.

Stuff wet shoes with oats or paper, and rub the outside with sweet-oil to prevent stiffening of the leather.

Plant dwarf nasturtiums just in front of your trench of sweet peas, and as the pea vines grow shabby at the bottom the the nasturtiums will screen them.

If a little sweet milk is rubbed over the tops of rolls or loaves of bread (just enough to moisten them) before they are placed in the oven, the crusts will be a rich brown and much softer.

If there's the faintest suspicion of moths about the edges of the carpets cover with a damp cloth and iron with very hot irons that will drive enough steam through to destroy moths and their larvae.

All nails and hooks used where damp articles will be hung should be dipped in paint and dried before being put up. Then there will be no rust.

To swallow a dose of castor oil heat a cup by pouring boiling water into it. As soon as the cup is thoroughly heated, pour the water out and immediately put into the hot cup your dose of oil. You can then swallow it as you do a raw egg, and with as little inconvenience.

Improved Ironing Board.

The ordinary ironing board may be made much handier for ironing garments of all descriptions, but especially skirts and shirts, by the use of a saw, plane and square. Notches are made near the ends, to allow the tips of two chairs to pass through, while a clothes basket or some heavy object placed on one of the chairs will steady it.

Darning Wool.

Before mending stockings, socks, or any woolen material, place the skein or card of darning wool over the spout of a kettle of boiling water. By this means the steam shrinks the wool, and when the stockings are sent to the wash there will be no fear of the mended portion shrinking away and tearing the surrounding part.

Hints for the Bathroom.

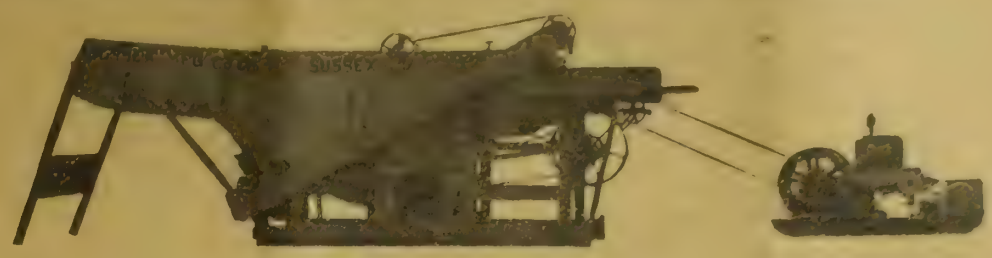
1. Open the window, top and bottom.
2. Take out all the soiled towels, washcloths and linens.
3. Take out the rug, if there must be a rug, and leave it in the air a while after shaking.
4. Run hot water into the bath-tub with dish of ammonia or soda or plain soap, and scrub well— ends, sides and bottom. Rinse well with hot and cold water and wipe dry.
5. Wash all sponges and hang in the air to dry.
6. Wash soap dishes, mugs, slabs, faucets, bowl and closet with soapy water, and wipe dry.
7. Wring a housecloth as dry as possible and lightly wipe over the closet seat and lid and all woodwork, and last of all, the floor.
8. Bathroom walls should be painted to permit their being washed frequently. Painted walls are much more sanitary than walls covered with paper, and more easily kept clean.
9. Where possible, the floors and walls up to four feet in height should be made of tiling. This material is moisture proof, and will not absorb odors.

Furniture Polish.

This is a very effective and quickly made furniture polish. Take equal parts of turpentine and vinegar, and a quarter part of salad oil. Mix all well. To use, dip a flannel rag in the mixture, and rub it well on the furniture; then polish with a duster. I have never used any other polish since I was married, twenty-one years ago, and a girl whom I had recently said my home was like that of a newly-married woman. That speaks for itself—I mean the newness and preservation of the furniture.

The Best Judge of a Thresher Is the Man Who Has Used It

It is not the purpose of this advertisement to tell in detail the merits of the Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Any reader who is thinking of purchasing a Thresher, will get our descriptive catalogue on application.



Four Horse Thresher.

Description of Four Horse Size

Dimensions of Cylinder -	17x30
Size of cylinder shaft,	1 1-2 inch
Speed of Cylinder,	900 to 1000 Rev.
Size of Sieve - - -	31x36
Weight not mounted,	1700 lbs.
Weight with wheels etc.,	2200 lbs.

Woodstock, Dec. 12th, 1911.
THE SUSSEX MANUFACTURING CO.
Sussex, N. B.

Dear Sirs:—I can say in regard to your Four Horse Threshing Machines, that I have used many makes of machines, but will say that the Sussex Little Giant is the best I ever used, it runs easy and cleans good and without any waste of grain.

Yours truly,
F. D. BURPEE.

This is just one of hundreds of similar testimonials we have.

We make the Little Giant Thresher in four different sizes: one horse, two horse, four horse and ten horse power.

Threshers can be supplied with or without tailings elevator and bagger. Every machine is guaranteed for one year against all defects in workmanship and material. We carry a large stock of Thresher Teeth and other repairs.

All enquiries will receive prompt attention.

The Conditions Essential for the Most Successful and Profitable Growth of the Clovers.

(Continued from page 705)

ly tried to warrant an expression of opinion concerning their value, but the method, at least judged from a scientific point of view, appears better calculated to yield successful results than the earlier method.

It has been urged that the bacteria sent out in culture form are selected and especially vigorous forms, and that accordingly, even in cases where the soils contain the right species of bacteria, the clover crop may be increased, or be enabled to draw nitrogen in larger quantity from the air through suitable inoculation with these improved cultures. It does not appear to the writer that this point has been as yet proved, and in conclusion he would go on record as most emphatically advising against the use of cultures for clover, unless, indeed, it is found on experiment that clovers do not develop in any given locality the characteristic nodules.

The Nova Scotia Agricultural College, Truro can supply nitro-culture at 25 cents per bottle. When ordering Nitro Culture state the particular leguminous crops on which you wish to use it.

Thinning Fruit.

"The marked improvement in the care of orchards and the increased interest in fruit growing in Canada, are notable features of the last few years. During last winter the agricultural colleges held short courses, in all of which an enthusiastic interest was shown, but in none was the increased interest so marked as in the horticultural subjects. The attendance at fruit growers' meetings reflects this increased interest, and those who are following fruit growing as a profession formed a higher percentage of the attendance than has been the case in former years. This change of sentiment is also noticeable in the reports of our correspondents. Constant remarks are made with reference to the culture and care of the orchard, and an eager interest in these subjects is manifested where formerly there was little, if any.

"Thinning" is engaging the attention of the fruit growers. This practice has always been common in British Columbia, but was practically unknown in the East until a few years ago. One of the complaints in the case of Nova Scotia apples has been their small size, and some orchardists there have declared that Nova Scotia did not grow as large apples as the other provinces. It has been demonstrated conclusively that thinning and good culture will remedy this want of size, and particularly where apples set as heavily as they do in Nova commonly practiced, nor does it appear to be so much needed, though there are cases whrre it has proved exceedingly valuable. The set of fruit in Ontario is scarcely ever so heavy as in the extreme east and west, and the soil and moisture conditions are such as to yield a fair-sized fruit without resort to thinning."—The Fruit Crop Report for May.

San Jose Scale Again.

Mr. G. H. Payne, Entomologist was in town last week. Mr. Payne, with his assistants, are making a thorough search of the orchards in the valley to discover the presence of SAN JOSE SCALE. Mr. Payne informs us that up to the present he has cut down, or had removed from the orchards in the valley, about 300 trees. Live Scale was found on trees imported from Ontario and set out in 1910, 1911, and 1912.

Even if it was necessary to remove 50,000 trees the loss would be fully offset by the saving in extra spraying made necessary by their presence in the orchard during the next two or three years.

Another thorough inspection of all the orchards in the valley will be made later in the season. When will the orchardists of the valley decide to raise their nursery stock right here at home, and free from liability to infection? No better facilities and conditions for raising nursery stock are to be found anywhere in the Dominion than are to be found right here in the Cornwallis Valley.—Western Chronicle, Kentville, N. S.

$50 Bank ... No. 52041. ... treal.
Pay ... Dollars

108 Cheques Will be Distributed Among Canadian Farmers. Will You Get One of Them?

In addition to the twenty-seven first prizes of $50 each, there will be eighty-one other cash prizes, ranging from $10 to $25 in our

1912 PRIZE CONTEST FOR FARMERS

This contest is along the same lines as the one which was so successful last year, except that there are three times as many prizes, and therefore three times as many chances for each contestant to win. Every farmer in Canada who uses "Canada" Cement is eligible to compete. The conditions are such that large and small users of cement have equal opportunities to win a $50 prize.

The contest is divided into three classes, and there are first, second, third and fourth prizes ($50, $25, $15 and $10) in each class.

CLASS "A"—Prizes to be awarded to the four farmers in each province who use most "Canada" Cement on their farms in 1912.

CLASS "B"—Prizes to be awarded to the four farmers in each province who send photographs of the *best concrete work* done with "Canada" Cement on their farms in 1912.

CLASS "C"—Prizes to be awarded to the four farmers in each province who send the best *description*, telling how any piece of concrete work was done with "Canada" Cement. (Entries for this prize must be accompanied by photographs of the work.)

In addition to thus being divided into classes, so as to give small users of cement an equal chance with those who use more, the Contest is also divided into nine divisions, one for each province. So you see you need only to compete with the other farmers of your own province, and not with those all over Canada.

Don't think that because you have never used cement, you cannot win a prize. Many of last year's prize winners had never used cement before they entered the Contest. We will send you a free book, "What the Farmer Can Do With Concrete," that will not only help you in the Contest, but will tell you everything you could want to know about the use of cement on the farm.

Don't delay, but send us your name and address to-day and get this free book and full particulars of the Prize Contest right away.

Use a letter, postal or coupon.

Send me particulars of your 1912 Prize Contest.

Address Publicity Manager

Canada Cement Company Limited

501-561 Herald Bldg. - Montreal

A free book, "What the Farmer can do with Concrete" will be sent to all who request details of the Prize Contest.

FLORICULTURE.

Enquirer, St. John, writes;—I enclose leaves of Rowan tree that is partly dead, what is the cause?

I regret to say that I could not give any idea as regards disease of tree and trouble with L;ly of the Valley without seeing the plants and surrounding conditions. If correspondent will send address I will call at first opportunity.

The long cold period during the first of the season has been very hard on the garden plants. I am afraid that many tender annuals will hardly recover from the shock. Stocks and Mignonette seem especially affected. The first blooms on such plants should be snipped off and branching encouraged.

Do not apply any liquid fertilizer until the last of July or until growth has become well established.

Sweet Peas look well and they should receive some support in the way of a trellis or sticks as soon as six inches high. A little heaping of the soil around them is a great help.

St. John, writes:—My Rose bushes are infested with green lice which are clustered about the tips and buds. They are very plentiful. Please tell me how to get rid of them.

Soak a fig of tobacco in one quart boiling water for a few hours. Dilute this one half strength and sprinkle the buches. Two applications will usually suffice. Strong castile soap suds is also good.

The following are a few receipes for the commoner insect pests that are busy this week. For the slug that eats the Rose leaf use kerosene emulsion as a spray. Make it as follows;

1 gallon kerosene oil
½ gallon water
½ lb. hard soap

Dissolve soap in soft water and mix with oil. Of this gluey mixture take one part to ten parts water and be particular to stir well while applying.

If instead of this you prefer whale oil soap (equally good) use one part to eight parts water.

For green lice use tobacco water the emulsion is also good.

For slugs or leaf eating worms on shrubs use hellebore. One teaspoonful to one gallon water—apply during bright sunshine.

Anxious Inquirer, Rothsay, writes:- I am writing to ask assistance with my garden. The old fashioned Peonies are not flowering but my neighbor's are although my plants are much larger than hers. They have bloomed each spring for twenty years but last spring not as well and this spring not at all. There does not seem to be any insects or anything to bother them. They simply do not bud. What can I do to make them bloom? I planted a number of Asters that I bought in the City; The leaves and also the bottom of the plants are beginning to shrivel up, the tips are growing, however, do you think they will come along all right?. My Sweet Alyssum plants were in fine bloom when I planted them but they are now turing brown and look badly, what can I do for them?

Your Peonies are so thoroughly root bound that they will not flower again until the roots are divided and given fresh soil. In the fall, after the leaves are frosted separate the clumps of roots into quarters with a sharp knife or axe and plant each quarter in rich soil in different spots. The second year they should all be good as ever.

IF YOU WISH TO BE WELL

YOU MUST KEEP THE BOWELS OPEN

Any irregularity of the bowels is always dangerous, and should be attended to at once. If the bowels cease to work properly, all the other organs become deranged.

Milburn's Laxa-Liver Pills work on the bowels gently and naturally, and will cure the worst cases of constipation.

Mrs. J. Hubbard, Port Colborne, Ont., writes:—"I have tried many remedies for constipation and never found anything so good as your Milburn's Laxa-Liver Pills. We always keep a vial in the house, for we would not be without them. I always recommend them to my friends."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

P. E. I. July Circular.

The weather during the last month has been too dry for the favorable growth of crops. The total rainfall amounted to 1.71 inches. The first week of June was very showery, the second fine and cool with a lot of north west wind blowing. There was a very heavy rainfall on Monday, June 17th. The last half of the month was fine and warm with the exception of Sunday the 30th., which was cold and showery. Up to the time of writing, July has been very warm and dry, light showers however fell on the evening of the 8th., and 9th. A heavy fall of rain is badly needed. Pastures are beginning to be pretty bare. The hay crop will be very much below average and weedier than usual. There is very little of last year's crop left over so that it will likely be very dear. Quite a lot of oats and peas will be cut green and made up into hay. All kinds of grain look healthy. Growth, however, has not been rapid and the straw is short for the season of the year. The dry weather is beginning to effect the colour.

Potatoes have come up well and are making rapid growth. The potato beetle is very plentiful. A considerable amount of Arsenite of Lead will be used this year instead of Paris Green.

Turnips, where sown early, are doing well, the cut worm is making great destruction among those sown later. It is reported to be cutting even potatoes.

Quite a lot of the corn failed to come up. Some fields however are exceptionally good.

There is a fair setting of apples, plums and cherries and an abundant setting of strawberries and bush fruits. The dry weather is however shortening the crop of strawberries.

Weeds are continuing to spread. The present season has been very favourable for them.

All kinds of live stock are scarce and dear.

The following are the market prices for July 10th., 1912.

White Oats	$1.91	per	hundred	lbs.
Black Oats	8.00	"	"	"
Potatoes	.67	"	"	"
Wheat	2.15	"	"	"
Hay	.76	"	"	"
Straw	.31	"	"	"
Beef Cattle	6.75	"	"	"
Butter	22.00	"	"	"
Eggs	.20		per dozen	
Strawberries		3 boxes for 25c.		

If you are a housewife you cannot reasonably hope to be healthy or beautiful by washing dishes, sweeping and doing housework all day, and crawling into bed dead tired at night. You must get out into the open air and sunlight. If you do this every day and keep your stomach and bowels in good order by taking Chamberlain's Tablets when needed, you should become both healthy and beautiful. For sale by all dealers.

Forage or Mould Poisoning.

Iowa farmers have suffered heavy losses in the past few months by the death of horses from a disease that affects these animals almost exclusively. It is usually fatal; it is not contagious, and it is quite certain that it comes from the eating of moldy fodder or grain. There is only one safeguard againgt it and that is the rejection of any feed that shows signs of mold. Ensilage and corn fodder of any kind and hay from swampy lands need to be inspected with special care, for they are the most likely to be moldy. Cattle often seem to eat spoiled plant food without harm, but to horses it is poisonous.

It usually appears in isolated outbreaks and generally the horses on a single farm in a community are affected. In some cases where horses are not fed alike, only those given a certain kind of feed are taken sick. In these facts there is quite conclusive evidence that the disease is associated with the food eaten and that it is not transmitted from one animal to another. The outbreaks appear more frequently in low, swampy districts because conditions there are more favorable for the development of the molds and the undesirable changes in plant foods believed to be responsible for the disease. It is not by any means confined to these districts, however, nor is it limited to any certain food stuff. It merely occurs more frequently in some foods than others, due to their nature and method of storing.

CAUSES

Forage poisoning is likely to appear whenever moldy grain or fodder is fed to horses or mules, but it does not follow in every case where such food is given. Moreover, it very seldom affects cattle. Horses and mules may sometimes be fed for a considerable time on fodder containing more or less mold without sickness while in other cases a comparatively small amount of such feed will cause death in a short time. Danger lies in the use of fermented foods, also, on account of poisons developed in fermentation. Some plants are likewise poisonous at a certain stage of their growth or when partially wilted. This is true of sorghum, particularly the second growth, which in some cases causes almost instantaneous death.

There are several molds which grow on food materials under certain conditions which are more or less injurious. The most common are the black mold, the blue mold and the green mold. They are found frequently in ensilage, corn, hay, oats and ground feeds. Moisture favors their development on all food stuffs.

ENSILAGE

Ensilage is one of the most important and valuable foods available to the Iowa farmer, but it is often responsible for forage poisoning. Sweet ensilage is of proved worth as a feed for horses as well as for cattle, but speaking generally ensilage feeding is attended by some dangers that the owners of silos should know. Ensilage contains the necessary moisture and, in most cases, the required heat, to favor the development of molds. On this account it is more often a cause of forage poisoning than other food stuffs. Perhaps 80 to 90 per cent of the outbreaks reported to this station come from feeding moldy ensilage. The quantity of mold may be so small as to be overlooked and yet be dangerous. Especially is that true of hay coming from low, marshy ground; though the mold in it may not be seen at first glance, there may be enough of it to produce poisoning and death.

Moldy corn has been responsible for several outbreaks of forage poisoning. Ears that have been attacked by the corn ear worm are particularly liable to be moldy.

SYMPTOMS

Two forms of the disease are most common, the acute and the sub-acute.

In acute forage poisoning loss of appetite and lack of thirst, associated with depression and lack of spirit are usually the first symptoms. Following this usually comes unsteadiness of gait and inability to control the hind quarters, which become worse until the animal either lies down or falls and is unable to rise. At the same time there is in practically all cases a paralysis of the muscles of the throat and cheeks as a result of which there is a slobbering due to inability to swallow, and a flabby condition of the cheeks which appear swollen and pouched. After the animal is unable to rise it will sometimes lie quietly for hours, and sometimes it will struggle or show spasms at frequent intervals. In acute cases there is usually profuse sweating and many times a peculiar staring appearance of the eyes. The temperature is normal or frequently below normal, which is contrary to the fact in contagious diseases. The breathing is usually irregular and jerky. The acute cases generally die after a course of 12 to 72 hours and are usually the first animals to be affected after moldy food is eaten.

In sub-acute cases the symptoms are similar to those in acute cases but they do not come on so suddenly and are less violent. The sub-acute cases occur among animals that have eaten less of the poisonous food and they are the last to show symptoms. Dullness and difficulty in swallowing, associated with slobbering and dropping partially chewed cuds of food into the manger and feed box, are early signs of the disease. These are followed by increasing paralysis, especially of the limbs, weakness, and often indications of delirium. In fatal cases death follows in from several days to a couple of weeks. A few of the less severe cases may recover.

The length of time between the feeding and the appearance of the symptoms, the suddenness of the attack and its duration, depend upon the amount of poisonous food taken. The course is shorter, from 2 to 4 days, the attack is more sudden, and death soon follows in from 12 to 36 hours when large quantities are consumed.

PREVENTION.

Since horses and mules are very liable to poisoning with moldy foods where cattle may eat the same foods with little or no danger, the method of preventing the disease is clear. Under no circumstances feed horses or mules ensilage that is in the least moulded or decayed. In feeding ensilage to cattle do not put it or scatter it where horses or mules can get to it, for they will sometimes eat the leavings in the feed trough after the cattle have picked out the best food. Do not throw waste ensilage where horses or mules can reach it. Sweet ensilage is a wholesome food for horses and of known nutritive value, but unless it is certain that it is perfectly fresh and free from mold it should not be fed to horses at all. Moldy silage has already caused such heavy losses on some farms that it will take all the profits a silo can bring to make good the cost.

The hay, corn, oats and other grains fed to horses should always be of the best quality and the water troughs should be kept clean and the water pure and fresh. With all these precautions, forage poisoning can be eleminated.—C. H. Stange, Iowa Agricultural Station, Ames, Iowa.

Butter Makers Over Run.

In Denmark the salary of a butter-maker depends on the over-run he secures. This compels him to give attention to this important feature of his work. The law limits the amount of water he can incorporate, so there is no danger on that point, but it makes the butter-maker who gets a 12 per cent. over-run "sit up and take notice." The Danish Government assists the creamery in this as well as other features of creamery work, and many analysis of butter are made at the Government laboratories.

In that country of keen competition and small profits the success of a creamery depends on the over-run it secures and uniformity in over-run is also important. It will not do to get 13 per cent. one day and 18 per cent. the next. The 18 per cent. butter may get the creamery in trouble and the 13 per cent. butter will mean a financial loss.

Minard's Liniment Co., Limited.

Gents,—I cured a valuable hunting dog of mange with MINARD'S LINIMENT after several veterinaries had treated him without doing him any permanent good.

Yours, &c.,
Wilfrid Gagne,

Prop. of Grand Central Hotel, Drummondville, Aug. 3, '04.

EATON'S SEMI-ANNUAL JULY & AUGUST BARGAIN SALE

MONEY-SAVING OPPORTUNITIES FROM CANADA'S GREATEST MAIL ORDER HOUSE

SEE TO IT THAT YOU GET THIS CATALOGUE OF BIG VALUES

RU-BER-OID Roofing

TRADE MARK REGISTERED.

In Red, Brown and Green

(Canadian Patents 93,027 and 93,160)

RU-BER-OID is the only ready roofing made in **permanent,** impregnated colors. The colors are not painted on, but by our patented process are incorporated in the RU-BER-OID gum with which the roofing fabric is coated.

As a result the color cannot peel or wash off—it stays as long as the roofing lasts.

If you want a roof that is handsome, easy to lay, weather-proof, fire-resisting, moderate in price, and that will give you fullest satisfaction and service, use RU-BER-OID in colors.

Any RU-BER-OID Dealer will gladly give you samples, or we'll mail them to you on request, with our Booklet, "RU-BER-OID—Why?"

One pure bred Aberdeen Angus heifer guaranteed in calf. Also an Angus Bull, 1 year old in August. They are of different breeding from prize winning stock at Ontario Shows. Also dual purpose Shorthorns.

Laurie M. Anderson, Sackville, N.B.

SEA VIEW STOCK FARM

Buctouche, N. S

Offers for prompt sale:—
1 Holstein bull 3 years old.
1 Holstein bull 16 months old.
2 Holstein bulls 7 months old.
1 Holstein Heifer 7 months old.
All from good milking strain and prize winning stock. Must be sold early to make room for new stock.

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man or his blacksmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof lumbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous rains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book, 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card, because you can plan your barn from it, whether you use my 100-year roof or not."

326

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."

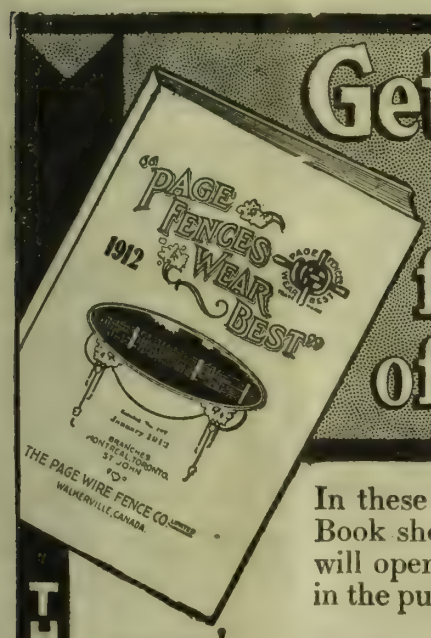
PUBLISHED TWICE-A-MONTH

The MARITIME FARMER
AND CO-OPERATIVE DAIRYMAN

Published Twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada.

Vol. 17. SUSSEX, N. B., AUGUST 13, 1912 No. 21

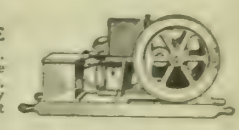


Get this New Page Book -and learn how to equip farm, factory, home and office at factory cost.

THIS COUPON BRINGS

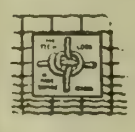
In these days of high cost of materials this remarkable new Page Book should find a hearty welcome in every home in the land. It will open your eyes to great savings—savings that can be made in the purchase of things needed every day as equipment on the farm, in the factory, home or office. Don't pay the usual prices—get your copy of this book to-day, and learn how to buy right.

PORTABLE GAS ENGINE
11-2 H. P. 4 cycle. For either gasoline or kerosene. Simple, efficient and very difficult to get out of order.



SAVE BY BUYING DIRECT
Page Wire Fences and Wire Products are known by thousands for their quality and their low price. In the same way the many lines in this new Page Book (which you get by sending the coupon) give you the greatest values the dollar can buy in each line. You buy direct and save go-between profits. You buy from a house rigidly interested in keeping up quality. Everything shown has got to be, and IS, right—a big-value bargain. Become a Page customer along with other prosperous thousands of wise buyers. The first step is to send the coupon for the catalogue. The Page Book gives items that overwhelm you with their usefulness and value to YOU in your daily needs. Send to-day.

THE REGINA PNEUMATIC CLEANER
The Regina Pneumatic Cleaner is wonderfully easy to operate. Light weight. Double vacuum pump cleans far better than ordinary methods. Cost low.

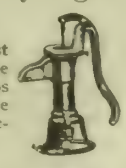


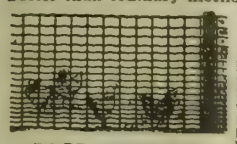
37 varieties of Page Fence in weights and mesh to suit all needs.

PIANOS
Made by one of the most famous makers on the continent. Rich, pure, lasting tone. A beautiful instrument.

PAGE IRON FENCING
Many designs, simple or ornate. For any purpose. Any price.

PUMPS
Made by one of the most famous concerns on the continent. Aylmer pumps are known everywhere for their fine construction and perfect work.





KITCHEN CABINETS
Finely built, beautifully finished. Save miles of walking around a hot kitchen. No bending over flour bins, no straining to reach things on high shelves. Protects food from dust, dirt, flies and mice.

PAGE "SPECIAL" POULTRY FENCE
Graduated mesh. Will turn poultry or large stock.

SCALES
Every scale is sold with a Government certificate guaranteeing its correctness. In all sizes for all purposes. Strong, compact.

HANDY WAGONS
These Handy Wagons are of the best. In all sizes, one or two horses, with or without boxes, Studebaker skeins, hickory axles, oak woodwork, steel wheels.

FAMOUS PAGE GATES
Acknowledged leaders of the world. Prices lowest.

FENCE TOOLS
We sell every tool needed in erecting any kind of Page Wire, or Iron fence; post hole diggers, bolt cutters, staples, locking tools, safety blocks and tackle, iron posts, fence anchors, etc.

STEEL RANGES
This famous make saves from 15 to 20 pounds of coal a day when used continually. Magnificently constructed. Bakes perfectly in a third of the time necessary with the old cook stoves. Asbestos lined flues, anti-clinker grates.

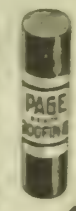
SOME PAGE PRODUCTS
Besides the articles illustrated, here are some of the Page products:

Lawn Fence	Fire Escapes
Poultry Netting	Waste Baskets
Marine Engines	Delivery Baskets
Wagons	Staples
Steel Posts	Horse Muzzles
Player Pianos	Jail Cells
Wire Cloth	Wheelbarrows
Wire Signs	Warehouse Trucks
Concrete Reinforcement	Tile Machines
Wire Partitioning	Paper Balers
Wire Mats	Pulleys
Window Guards	Belting
Tree Guards	Rubbish Burners
Office Fittings	Sleighs
	Grinders

and many more too numerous to list

PAGE HOUSE PAINT
Mixed ready for use. A strictly high-grade paint intended for exceptional wear. Inside or outside paints, floor varnish, etc. Send for free color chart.

PAGE ROOFING
The Roofing sold by the Page Company is the result of years of experience by a manufacturer known for the high quality of his product. It will not only afford perfect protection but will last for many years in perfect condition



STEEL WHEELS
Can be used on old gear or put on a new farm wagon. Fit any size spindle. For any kind of wagon from a hog cart to a traction engine. Finest quality of steel. Built to last forever.

You can readily see what a big line of farm and home equipment the Page Company places at your disposal—and every article at factory cost

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage . . You Can Leave Him. . .

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

DE LAVAL
CREAM SEPARATORS

RIGHT NOW THE BEST TIME TO BUY ONE

There was never before as good a time to buy a DE LAVAL Cream Separator as **right now.**

The hot weather is at hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator, which with present high prices means even more nowthan ever before.

Then there is the great saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.

This is likewise the season when the DE LAVAL superiority counts for most over other separators—in closer skimming, larger capacity, easier running, easier handling, easier cleaning and absolute sanitariness,

A DE LAVAL Cream Separator bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

Look up the nearest DE LAVAL agent **at once,** or drop us a line and we will have him **look you up.**

173 William Street, MONTREAL, CAN.

Makes Pigs "Stay Put"

The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 12

How I Made a Profit With Sheep.

By Andrew McPherson, Pictou Co., N. S.

Awarded Second Prize in the Maritime Farmer Sheep Raising Contest.

A good many years ago, the writer inherited a worn out farm the soil of which was naturally of a light sandy nature. A bad system of farming was not long in giving it the name of being the poorest farm in a district where poor farms predominated.

The practice had been to plow a field, take two crops of oats therefrom, sow a small quantity of timothy with the second crop of oats and then hay (if it would give it) and pasture for several years repeating the process over again. This method was carried on until the land would no longer yield any oats, when that field was abandoned and a new one broken up and put through the same treatment and always with the same results.

When the farm came into possession of the writer about 100 acres were cleared had yielded up the vergin fertility and as far as crops were concerned were valuless as a farming proposition.

At that time the "lure of the West" was strong and the fortunes made in wheat was doubled before our eyes in a manner that made the old farm look like thirty cents. However, there were family ties to be considered and the fact that it being the old Homestead appealed to us so we decided the matter. This decision was arrived at, after a failure on our part to dispose of it although offered at the ridiculous low price of $5.00 per acre.

Looking over the situation carefully and taking into account the poor condition of farm and buildings and knowing that live stock of some kind was necessary we decided to invest in sheep. Our forebears for generations, had been old county shepherds and the "instinct" was strong within us formed, no doubt, by the tales we listened to in boyhood days around a blazing log fire (often our only light) on winter evenings, tales that told of sheep herding in the glens and mountains of Bonnie Scotland.

Looking back over the many years since we purchased our first flock we have to acknowledge many mistakes, but through lean year, and years of plenty—years of adversityand years with a goodly share of prosperity—we have never, never regreted the choice we made for the flock always showed a profit, pretty small it it true at times but a profit never-the-less that tided us over many a drouth and when crops failed and other stock could hardly be given away, the little "mortgage-lifters,' kept the pot boiling and made several blades of grass grow where formerly nothing grew but weeds.

Our first venture was the purchasing of a flock consisting ef fourteen ewes, whose only redeming feature was their low price. They were bought at auction and cost $2.50 each or $35.00 for the lot with twelve months credit, the usual term, at auction sales in the district. Those ewes were a poor lot the result of years of inbreeding but they responded well to better care and feeding and began to improve in condition from the start.

For several previous years the agricultural Socities were experimenting with rams of the different breeds and had some good imported sheep. The Shopshire took our fancy on account of its ability to adapt itself to new environments and the early maturing qualities of the lambs which seemed to be ready for the butcher several weeks ahead of the lambs of the larger breeds. After choosing the breed we spent considerable time selecting the ram and we believe the time was well spent. We heard the maxim "the ram is half of the flock" and the result of our first selection proved its truth. The influence of the dam is shown in only one lamb or, at most, two while that of the sire is stamped on every lamb in the flock.

The ram we selected was one that was not much patronized by the members of the Society on account of being somewhat undersized, but he was what might be termed a "thyig little sheep" standing on short straight legs, short broad back, neck strong and smoothly joined to the shoulders, eyes bold and prominent giving him a very masculine appearance, face short, and well covered with the wool about the head, and with a dense fleece all over. He about fitted the bill in our estimation of what a ram should be.

The ewes got the run of the after feed for several weeks which with a little oats put them in splendid condition for breeding and the ram was turned with them early in November. As soon as all were bred they were dipped and sent to pasture. With the exception of one or two stormy nights they were not again taken up until early in July, when 14 lambs and one dry ewe were sold to the butcher. The lambs bringing $2.50 each and the dry ewe $4.00; $39.00 in all and leaving 3 ewe lambs in flock. The result of this first venture in sheep was as follows:

Dr.		
14 ewes at	$ 2.50	$ 35.10
Turnips 100 bush. at	.10	10.00
Oats 25 bush. at	.10	10.00
Bran 5 cwt. at	1.00	5.00
		$ 60.00
Cr.		
14 lambs at	$ 2.50	$ 35.00
1 ewe at	4.00	4.00
60 lb. wool at	.24	14.40
3 ewe lambs in flock at	2.50	7.50
		$ 60.90
Credit Balance		$ 0.90

thus paying for the original flock, adding 3 lambs to flock and $0.90 to the good. As the hay used was absolutely unsaleable we consider it being turned into manure very good value while the clearing up of weeds in the pasture more than paid for time expended in fencing and taking care of the flock.

The flock was also greatly improved and by the judicuous use of sires the progeny of this flock, 35 in all, was sold at auction 5 years later and averaged the handsome price of $5.60 per head.

The improvement in the condition of the pasture was so noticable that we resolved to stick to sheep and again purchased another flock, this time a much better class of grade Shropshire ewes, securing at the same time the best ram of the same breed that our means would allow.

This ram was a prize winner in Ontario and his lambs were an exceptionally good lot, proving to our satisfaction that "like produces like". They were so true to type that we used one of his ram lambs for two seasons in the flock. [illegible] inbreeding. While in a general way we do not reccommend this as it gave us, in this instance, what we were striving for viz. the true Shropshire type and landed the flock at the top of the prize list at the Provincial Exhibition, Halifax, for grade Shropshires. Figures in this case would only be a repetition of the others. Having better sheep and greater [illegible] we had also corresponding greater [illegible] business that we purchased a few [illegible] ewes and [illegible] the

breeding of registered stock, gradually working out of grades until for years back the farm has carried nothing but a purebred flock that has proved eminently satisfactory as a paying proposition. As this article has only to deal with a commercial flock we may, at some other time, give the Maritime Farmer readers, some of our experiences in breeding purebreds, fitting for show, etc.

In looking into the decline of the sheep industry in the Maritime Provinces, the causes therefore may be summed up under the following heads: The dog nuisance and the lack of proper fences, neither of which is unsurmountable. Regarding the dogs, the people have the laws in their own hands and it is up to them to see that they are enforced. When we went into the business we gave it to be understood that our sheep pasture would be an unhealthy place for roaming dogs, and very soon neighbors, who had dogs with a propensity to wander, began to sit up and take notice. In our twenty-five years experience we have never lost a sheep by dogs but of course we had to take precautions, one of which was to have some dog-proof hurdles made and on several occasions when dogs were troublesome the hurdles were used to good advantage. Hurdles are quickly and cheaply made by nailing light sawed rails to posts that are sharpened at one end and driven into the ground to form an enclosure, the upper end of posts being wired together. A handful of oats or salt will soon induce the sheep to go there when called and it is always a delight for the boys, and sometimes the girls of the farm to fasten them in and let them out again in the morning—thus ensuring the flock against the attack of dogs during the night. These hurdle enclosures were always put up on the highest, dryest knoll in the pasture and being easily removed from one knoll to another, the result was that these knolls soon became the most fertile places on the farm and always looked green as far as the eye could see.

The other objection—the lack of proper fences—is easily overcome. It requires no more material to fence for sheep than for other stock, except that it has to be put up different. We have never found anything that ,has answered the purpose as well as the old fashioned post and rail fence, using sawed rails and posts sharpened and driven. The rails should be one inch or one and one-quarter thick six inches wide and ten feet long. Four rails high is sufficient and the rails can be sawed out of lumber that is good for nothing else, fir, cat-spruce and hemlock all are suitable. If the fence is built on an embankment or side hill, three rails high would be sufficient and as the posts are sharpened they can easily be driven back if thrown up by the frost. Rails should be nailed on alternate sides of the posts to balance better and get a better nail hold. The cost of this fence should not be more than twenty cents per rod, labor included, and we have been able to do it as low as fifteen cents.

When we first started with sheep the pasture was so poor that we had to have some acres of rape near by to help out, and so arranged at first that only the lambs could get in, and later when the pasture got very bare, all were allowed in and it is surprising how far a small piece of this splendid forage crop will go to supplement a dry pasture. As time went by, the pasture began to so improve that this was unnecessary, and the rape was used only when fitting for show purposes.

A few points that we have to look for in ensuring success in the sheep business may be mentioned, as the result of out twenty-five years practical experience. Following in their importance are: Selection of suitable sires, keeping the best of ewe lambs, studying the flock and culling out ewes that fail to be good mothers, changing the pasture often, variety of winter feed, freedom from ticks which can be cheaply done by dipping spring and fall and regular exercise for the in-lamb ewes. Some of the results that may be expected from a well kept flock are; Profit derived from many sources, little expense as no costly buildings are required, destruction of weeds, even distribution of manure on pasture insuring increased fertility year by year, light work that is generally performed by the boys for pure love of it, keeping the boys on the farm by letting them handle their shares and lastly, providing the family with clothing and furnishing the table with the most wholesome of all meats and supplying a market, the demand for which far exceeds the supply at a figure that places the flock in the lead of all other live stock as a revenue produce.

Spraying For Black Spot---Experiences of 1912.

By Manning K. Ells, Secretary N. S. Fruit Growers' Association.

The season of 1911 left many spraying questions undecided, and many problems still to be solved by Nova Scotia Fruit Growers. Lime Sulphur as a summer spray was first widely used in the Valley last season, but on account of the dry summer there was no development of apple scale fungus, and the question whether lime sulphur would control black spot or not was left unproven.

Only a few men have had perfect results from the old Bordeaux Mixture. Under certain weather conditions on some varieties of apples, particularly the Gravenstein and Ribston, both desert apples, where a fine finish is desirable, Bordeaux caused a rusty disfigurement, often spoiling altogether the sale of the fruit.

Yellow leaf was common in Bordeaux sprayed orchards and the foliage was frequently more or less injured. With the growth of large orchards has come the power pump, that handles from eight hundred to fifteen hundred gallons of spray a day, and to mix this quantity of Bordeaux properly would take much time and considerable equipment. The time was ripe for something better as a summer spray and from reports from other orchard districts, Lime Sulphur seemed to fill the bill. For climatic reasons, Annapolis Valley apples are peculiarly susceptible to Black Spot. The moist winds from the Bay of Fundy and Minas Basin give an atmosphere of high humidity. Heat and moisture give perfect conditions for the development of moulds and mildews and all kindred fungi of which Black Spot is our most common example. Different parts of the Valley vary in this respect and better results from spraying have been attained in the West than in the Eastern end near Minas Basin. The Inland valleys of Oregon, Washington and British Columbia, shut off from the sea by high mountains and so dry that irrigation must be practised have not the fungus problems to face solely because of their dry atmosphere. As I said before spraying results from Lime Sulphur last season were inconclusive, but this year's experiment is letting a little more light on the question, and some fruit growers are showing beyond doubt or question the possibility of raising a perfectly clean crop of apples even in a year most favorable to Black Spot development. Spraying to be successful, has three essentials which must be observed— First the spray mixture must be properly made. The commercial Lime Sulphur as sold in the Valley, generally tests from thirty-two to thirty-three Beaume. The home boiled not so high and in using the latter more concentrate should be used that the spraying mixture may be as efficient. As a poison, Arsenate of Lead is used exclusively because of its adhesiveness, the fact that it does not settle easily, and its addition to the Lime Sulphur increases the fungicidal value of that spray about fifty per cent. There are two widely used brands on the market, both good; many farmers buy the "chemicals" and mix their own poison with good satisfaction as a spray mixture and a considerable saving to their pocket.

The second essential. —The spray must be correctly applied. Those who attended the annual meeting of the Fruit Growers in Windsor in 1910 will remember that Professor Wallace in his address on spraying, gave a life history of the spores or germs of the Black Spot. The spore wintered on the dead leaves and when conditions are favorable for its development in the spring, usually about the time the leaves come out, they begin to multiply and give off or shoot off into the air millions of tiny spores or fungi seeds that are carried by the wind to light on growing leaves and fruit, and if they find a suitable lodging place there develop into what we know as Black Spot. These spores only await a favorable period that a a moist warm spell of weather to begin their growth; and understanding this we can see how important it is that every leaf and fruit surface should be coated with some fungi killer, such as Lime Sulphur, that the infection cannot get a favorable lodging place. To do this thoroughly is not an easy job. Some advocate spraying with the wind one day and then waiting for the wind to change to spray the other side of the tree. This might do finely for one tree, but as a commercial proposition it is utter nonsense. With a proper power outfit and an intelligent man in charge, practically the whole leaf surface can be covered. Pressure of 175 to 180 pounds should be carried. Below this is not enough; anything higher is not needed. In the sprayer shown in the illustration the man on the top carries a fourteen foot rod with two ministery jr. nozzles on a branching Y, crooked at an angle of 45 degrees. This angle nozzle is one of the greatest improvements as an aid in applying the spray in the most efficient manner. The spray can be directed down into the top of the tree, or by twisting the rod, other side can be covered without shifting position. The fourteen foot rod is not tiring to the operator, for it is balanced in his hands by the weight of the hose as shown in the picture. The man working on the ground has a twelve foot pole and for the sake of economy only carries one nozzle; and his duty is to spray what the man on the tower cannot reach. The tower man can give directions to the driver and can see exactly what parts of the tree are not touched. By working at right angles to the wind practically every part of the tree can be covered. The outfit shown might not suit the peculiar conditions of some orchards. Each man must settle that according to his needs. Now I come to my third essential—and that is—The spray must be applied at the proper time. The leaves and fruit grow so rapidly in the spring that new surfaces are continually being exposed. So no matter what the season, three sprayings should be practised on principle as an insurance premium. These three just before the blossoms open, immediately they fall, and ten days afterwards should be given whether (in your opinion) they need it or not, like the boy who always washed once a month. If later sprayings than this are needed will depend on the weather conditions. If dry and sunny, the crop will be all right, but the years in this country, when an application from July 1st to 15th will not pay big interest are very few and quite aways between. This latter spraying needs only a small proportion of Arsenate of Lead, say two pounds to the hundred gallons. It is also a preventative of the fly speck or ink blotch spot that infects the fruit in July, but does not appear until the apples are packed in the winter. This fungus was very injurious two or three years ago. These three spraying essentials, a perfect mixture correctly applied at the right time, are all practised by the fruit growers getting the best results for their work. For these men the spraying bill is not a hasty task, because of the manifold returns. The men, who trusting to the experiences of last year have not sprayed at all, and the men who though lack of knowledge or indifference, have not done their work thoroughly are in the same box, both have a very large proportion of threes and culls due to the ravages of Black Spot. The Co-operative Fruit Companies by their high standard of packing are doing a great educational work in this fight for better fruit. In the old way of selling to speculators "tree run," the practise was to pay about one price to all, making the poor and good average up. The inducement to strive for better things when the reward is no greater is not a heavy one. In the Co-operative Companies each is paid for what he has and it frequently happens that the producer of spotted and low-grade fruit profiting by the lessons learned from his packing sheet when comparing it with his neighbor, is the high line man the year following. The great revival in the apple industry all over America, will have one certain result. Increased supplies and lower prices. Quality then will count. Our great natural advantages in relation to the markets of the world and the ease with which even our largest crops have been sold at good prices have worked against a higher standard in quality. We have accepted what nature has given us without attempting very much improvement, but the world moves and higher quality is becoming the watchword. In any successful scheme of orchard management thorough and systematic spraying is now imperative. The day of Luck and Guess So is passed.—M- K. E.

Clover Seed Production.

The common red clover is a biennial belonging to the Leguminosae. The plants belonging to this family draw from the air the greater part of the nitrogen they need growing in soils which contain hardly any, provided phosphoric acid and potash are present in sufficient quantities. A soil, far from being impoverished by a crop of clover, is fertilized by the resulting residues which contains a large quantity of nitrogen of atmospheric origin. Its long roots, nearly half the weight of the plant, absorb an amount of phosphoric acid and potash which cereals cannot get at, besides adding enormously to the humus in the soil. This humus binds together a sandy soil, and opens out a clayey one.

Clover hay is acknowledged to be superior to all others as a feed. Two pounds of clover hay contain about as much digestible nutrition as three pounds of timothy hay. The quantities of fertilizing matter in clover hay and timothy are in the same proportion as the feed values of these different hays.

It is not necessary to describe all the advantages of clover-growing. Unhappily, though its economic value is recognized in practice by most farmers, a great number still neglect the sowing of it as often as a good rotation demands, or they economize in the amount of seed necessary for a good growth. This condition of affairs is as often as not due to the cost of the seed; especially when it is 25c. or more a pound. And this is why I here recommend growing clover with a view to the production of seed.

HOW TO GROW AND REAP CLOVER SEED.—Red clover being a biennial, the seed is only harvested the second year, I would say the first year of meadowland. To get good results a thick vigorous growth is necessary; and from 8 to 10 lbs. to the acre, must be sown. It is usual to mow a field of clover intended for seed in the spring of the first year of meadow.

It has always already been proved by botanists and farmers in all countries that it is impossible to harvest clover seed from the first spring growth. The fertilization of the flower is helped by insects, the chief of which is the yellow bumble bee which, gathering the nectar or pollen, fertilizes the flower. Now, when the clover is in its first bloom the bumble bees are not hatched, for only the queen survives the winter; the young larvae appear about three weeks after the first blossoming. This is why the clover should be checked by mowing. The best time for this first cutting is from June 5th to June 20th. It is impossible to give an exact date because the clover is not at the same stage each year at the same date, but when it begins to form stems holding the flowers (lateral branches), it is time to mow. If the ground is dry it is a good practice to pasture instead of mowing. As a general rule it is better to mow early rather than wait for a harvest of hay, for the following reasons:—

1. It is generally dry at this time, and so it would be impossible to have a good second crop.
2. There is not much seed and it is of an inferior quality.
3. There is much damage done by the Clover Leaf Midge (Cecidomya leguminicola.)

WEEDING.—Mowing the Clover in June destroys a number of bad weeds; but to have a harvest that is practically free from them there must be two or three weedings. The weeds commonly found among red clover are Curled dock (Rumex crispus), Ribwort Plaintain or rib grass (Plantago lanceolata), the Field Thistle (Cirsium arvense), the Silenes, etc.

HARVEST.—It is important not to cut the clover till it is quite ripe, to ensure a good quality of seed. The best machine for cutting is the self-rake reaper. It shells least, and the crop is deposited in little heaps. Altogether the mower is not so good it can be used, but it must be heaped at once with a hand rake. To facilitate threshing the clover should be allowed to lie on the ground for three weeks. During this time if it rains much the heaps should be turned two or three times. The clover must be dry before it is housed, and handled carefully to prevent shelling. If the bottom of the wagon rack is not tight, cover it with a cloth, as the seed loosening itself from the stem is always the best.

THRESHING.—As soon as the clover is housed the best thing is to give it a first threshing (if there is no special clover thresher). Very little seed pods get broken from their stalks. For the second threshing it is better to wait till winter for at a lower temperature the seed shells more easily. But in spite of the cold a partition must be erected at the back of the machine, either of planks or sheet iron, with an opening that can be closed if wished. The object of the partition is to keep the seed in the cylinder. When this is too full, through the afore-mentioned opening the seed is allowed to escape. Although this method is certainly rather lengthy it is best where there is only a little clover to be threshed for it is thus possible to do the threshing of two acres in one day.

The machines specially constructed for clover threshing have two cylinders. The first is not unlike that of the ordinary machines. The second, called the "peeler" has a surface like a grater, as has also the partition which nearly surrounds it. This partition can be regulated close to, or far from, the cylinder as the clover threshes easily or with difficulty. The first cylinder makes about 1400 revolutions a minute, and the second 800. These threshers are equipped with the necessary apparatus for sifting and cleaning the seed and are run by steam or gasoline engines of from 12 to 15 h. p. They cost from $450 to $800.

I should not recommend any one person buying a thresher as the quantity of clover would be too small to make it pay, but bought by a good society or an agricultural club it would prove a profitable investment. These mills can thresh from 50 to 75 bushels a day; the owner charges 50c. a bushel or $1.50 per hour.

CLOVER YIELD.—This varies from 100 lbs. to 350 lbs. of seed to the acre. The thickness of the growth and the quantity of bloom indicate the yield. Just before maturity, the best thing is to test by rubbing the clover heads between the hands. If there is but little seed it is better to mow the clover, and make hay before it is too ripe. That is the usual course.

QUALITY OF THE CLOVER SEED.—There are four characteristics to be observed here:—

1. The absence of bad weeds.
2. Germinating strength.
3. Size of the seeds.
4. Their weight.

In estimating seed there must also be taken into account foreign matter which is always present such as stones, sand, rubbish, etc. Bright coloured seed shows that it is fresh.

OBJECTIONS TO THE GROWING OF SEED SLOVER.—One of the reasons advanced by some farmers for not growing clover seed is the uncertainty of the crop. To this fact is due the variable price of the seed. When the clover is in part destroyed by frost, or still more when drought prevails, the farmer should pay special attention to his clover.

Although this crop extracts the least fertilization from the soil some farmers affirm the contrary. Evidently those are they who expect their meadows to be as rich in growth after the seed harvest, as after the first year. But red clover is not a perennial. The reason the fields of red clover last more than two years when they are kept for seed is that they sow themselves each year, especially if the aftermath is not pastured. Nevertheless the hay yield decreases each year, and it not a paying practise.

ADVANTAGES OF CLOVER GROWING FOR SEED

1. It produces from $15 to $16 per acre, according to yield and market price.
2. The farmer who grows his own clover for seed is in less danger of introducing new varieties of bad weeds, and is less tempted to false economy in the sowing.
3. The seed is stronger and more resistant in its native district. The seed bought from the markets is generally of foreign origin and harvested in conditions of soil and climate totally different from those of our Provinces.—J. C. Cote.

Spraying Outfit Owned by Manning K. Ells, Secretary of the Nova Scotia Fruit Growers' Association.

Mr. Ells is holding the rod, Captain C. O. Allen, President of the Niagara Spray Co. is in the foreground. Note the thrifty condition of the trees which are fertilized only by excument from an adjacent hen house.

The Value of Careful Plant Breeding.

The cultivation of the sugar beet affords a striking example of the improvement that can be developed in a plant by careful breeding through a series of years.

The average percentage of sugar in the root has been increased during the last century in a high degree, as shown in the following table:—

In 1836 it required 1,800 lb. of roots to make 100 lb. sugar.
In 1842 it required 1,600 lb. of roots to make 100 lb. sugar.
In 1857 it required 1,200 lb. of roots to make 100 lb. sugar.
In 1871 it required 1,100 lb. of roots to make 100 lb. sugar.
In 1900 it required 750 lb. of roots to make 100 lb. sugar.
In 1910 it required 700 lb. of roots to make 100 lb. sugar.

And in some cases the sugar contents of the roots have been brought to even 20 per cent.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

PUREBREDS VERSUS SCRUBS.

In discussing this question, the viewpoint must be taken into consideration, but while this must now be done, the sooner the conditions which cause the negative side of this question to be entitled to notice are overcome by the onward march of progress, the better for all concerned, both those who now advocate scrubs, and those who do not. Pure-breds represent the highest type of progress and thrift, while scrubs symbolize primitiveness and sluggishness. The latter type of animals are esteemed by those who advocate them, because they are good rustlers, usually the opposite temperament of their owners. They require little attention and are worth little. The conditions under which they will exist and do better than purebreds are usually hard on man and beast. and, as we have already stated, the sooner such conditions give way before the march of progress, the better for all concerned.

Apropos of the times, the purebred is typical of progress, and stands for all that is best in his class; his owner also is usually a purebred, and if he is not, the type of the flock or herd soon lowers to the standard of the man, Thus, for example, if a man becomes impressed that all he need do to emulate those who have made a success of purebreds is to secure from a successful breeder one or more animals of the best type. If then, by neglect or improper management of the young and growing stock, too much inbreeding, etc., he lets the herd deteriorate and lose vitality, size and all that is desirable in high-class stock, he would be very wrong in his reckoning if he should lay the blame on "purebreds," or if an advocate of scrubs should say, "I know that common chickens and turkeys are healthier, lay more eggs and require less than care purebreds, but I am going to try some just to see what they will do." He writes for some of the cheapest stock he can hear of, and with little experience, quite admires the trio when they arrive, which look pretty good in comparison with his common flock, but he was a better prophet than he knew, when his purebreds succumb to the ravages of lice, mites, white diarrhoea and other troubles, besides lack of a balanced ration, clean quarters, etc, Few of the young chicks survive the ordeal.

Then as season after season follows without change of males, the chicks lose their vitality the grown fowl do not come up to the stanadrd in size weight and appearance at this stage of his "experience with purebreds," he convincingly remarks, "I told you they were not as good as scrubs,"

To the question, "Do purebreds pay?" we would answer: Yes, if their lot is cast amid congenial environments, a well-fenced farm, with plenty of cross fences and fields for the proper and profitable handling of stock and crops, good and sufficient water, and above all, under the management of a purebred farmer who does not despise the experience of others, and who is continually reaching out for more information as to the best practice in conducting his work.

With such a man purebreds are at home and are guided to success by a congenial spirit.

So with grain and roots, seed selection and proper tillage, and with fruit, the selection, setting out, pruning, spraying, etc. is a purebred's work if you would expect a successful outcome.

The purebred farmer is also familiar with the modern farm machinery, its proper care and use as one of the factors in "making two blades of grass grow where one grew before," accomplishing more and better work with less labor than by the old methods.

Let me give you one illustration of a farmer who is not a purebred and has neither time nor money to spend on an agricultural journal. He came over to borrow my large self-dumping rake. I cautioned him about its proper care, oiling, etc., and he was very voluble about the care he would give it. He took the rake away and left the hack in which he had come. I had occasion to use the hack and from force of habit examined the wheels so see if they needed oiling. Judge my astonishment in attempting to remove a wheel; it refused to come off. I twisted and pulled till I dragged the hack after me before I could get the wheel off and I found all four in the same condition. My mental comment was "My poor rake,"

A farmer may have the nature of a purebred and yet by surroundings and circumstances, not be able to take the advanced step he would like, but he is thinking and planning on that line all the time, and if there is a possible chance for advancement he is ready to take it.

The purebred farmer is an educated man, either in the old and venerated (but very costly) school of experience, or the more modern A and M. college with its combination of technical and practical work. What would you think of a man beginning to practice medicine in your community, having never taken a course of instruction in medicine, or of a man offering his services as a legal adviser, who had never made a study of the law? Then what is there incongruous about a farmer taking advantage of all the learning that science and mechanical skill offer for the advancement of his chosen profession, for it is a profession most exalted, where the brightest and best prepared minds may find unlinited opportunities for the expansion and development of their powers.

The keynote of endeavor in all lines is preparedness. Why should the farmer be an exception to this universal rule?

The great Gladstone once said, "It matters not so much what you do, as how you do it." Even a scrub, by use of the best methods, may be made to look pretty good, but he is not usually worth the cost. Be a purebred.—D. B. Waugh in Farm and Ranch.

BREEDING ASSOCIATIONS.

One of the most practical methods of securing good dairy cows is by means of a co-operative breeding association. By this is meant that eight or ten farmers living in one neighborhood organize an association and purchase a well bred dairy sire for a very small outlay on the part of each. On the farm where dairying is used as a side issue, this method will prove very advantageous because of its economy. Where the farmer milks his cows for the sole purpose of selling the butter fat to the creamery and feeding the skim-milk to the calves and hogs, the average herd numbers about eight cows. Thus if ten farmers organized such an association and used the sire in common, it would mean that the animal would not be over worked and that he could be used for many years.

The great difficulty in trying to persuade one man to purchase a good pure bred dairy sire, is that such an animal is to expensive. If however, ten famers purchase a bull together they could afford to pay a price which would enable them to buy an animal which would do a great deal for the improvement of their herds. In many instances it has been shown that a good prepotent dairy bull, with well bred ancestors behind him, will increase the production of butter fat from 30 to 60 lbs. in the resulting daughters. In this case the average production would be raised very quickly and with little added expense.

If such associations were organized, however, it would be very essential to secure the best animal possible. In order to do this, a man would have to be secured who is familiar with the various dairy breeds and could advise which of these breeds to select. It would also be necessary in purchasing the animal to demand a a record of his ancestors and be certain that they were high milk producers.

COMMISSION SELLING.

The present antiquated methods of consigning perishable fruits and vegetables to commission men of whom the growers know nothing will not continue under systematic selling methods It is responsible for much loss to both the growers and commission men.

Selling fruits and vegetables is too important to practise such methods. There is too much risk and nothing definite. The first requirement of selling through a commission man is that the grower know the commission man and the dealer know something of the man that grows the products he handles.

With express shipments there is far more chance for misunderstanding and dishonesty. The fruits and vegetables of the entire country should be handled in carloads as far as possible, and there should be just as few middlemen as will maintain the system.

"What a young man earns in the daytime goes into his pocket, but what he spends in the evening goes into his character."

Encouraging the Sheep Raising Industry.

Last spring Hon. Martin Burrell, Minister for Agriculture appropriated the sum of $15,000 to the Dominion Sheep breeders Associatian for the purpose of stimulating sheep breeding interests in the Maritime Provinces and in British Columbia.

Numbers of pure bred rams and grade ewes are to be sold by public auction this fall in various sections of the above mentioned provinces.

In order to ascertain the breeds needed and the approximate number required, the Minister asked Col. McEwen, a successful Ontario sheep man to come to the Maritime provinces. Associated with him on the commission while touring New Brunswick is Col. H. Montgomery Campbell, President of the Maritime Stock Breeders Association, who is an enthusiastic sheep breeder. The Minister also sent Mr. C. M. McRae of his own department. Mr. McRae has travelled the Maritime Provinces very extensively during the past ten years on institute work and as judge at our exhibitions and is as conversant with the conditions prevailing in the Maritime Provinces generally as any man in Canada. While touring Nova Scotia the commissioners had H. W. Corning M. L. A., Secretary of the Canadian Guernsey Association, who is also a successful sheep breeder, associated with them to represent his province.

When they go to Prince Edward Island, Mr. Roy Curtis will join them to represent the Island Province. They are at present touring New Brunswick. having completed their work in Nova Scotia.

The Maritime Provinces are particularly adapted to sheep raising and have much land that is better suited to that industry than to anything else. This coupled with the facts that Canada is importing live sheep at the rate of 180,000 and mutton at the rate of 3,500,000 lbs. per year, that we have a good home market, our proximity to the Boston and New York markets with a cheap water haul and even beyond this the great English markets ever ready to take the surplus should make the sheep raising industry of these provinces increase from the present status of about 600,000 to 6,000,000.

Our lamb has already made a name for itself in the American markets and there commands a premium over the western American product. By better feeding and breeding better prices could be obtained with ever increasing competition for our surplus.

Today Great Britain has no chilled meat trade because there is no country of the world geographically situated that has the necessary quantity to supply the trade. She imports yearly very large numbers of frozen carcasses from Australia and the Argentine. If Canada, particularly the Maritime Provinces had the supply they could not only capture but hold this market, as they are near enough to place chilled meat in the British seaports and have it distributed to the consumers in good condition.

It behooves all farmers in the Maritime Provinces who are interested in sheep and who would like to purchase pure bred rams or some grade ewes to keep themselves posted on the places and dates of the auction sales which will be announced later.

Harvest Excursions.

The railways are beginning once more to advertise their so-called "harvest excursions," by which they mean that they will attempt in a week or two to drum up large parties of farm laborers and others in the Maritime Provinces and haul them to Alberta and Sasketchewan in order that the railways may profit by the passage money. cn former years the C. P. R. charged less for the journey from the Maritime Provinces to the West than for the return trip, thus discriminating against residence in this part of Canada. If that policy is to be continued this year it will meet with the sharpest sort of protest.

For that matter, boards of trade and city governments throughout the Maritime Provinces should set their faces sternly against this annual organization of an exodus from the Maritime Provinces by the railroads. When the census returns were published recently it was found that during the last ten years Nova Scotia had lost more than 20,000 of its population, and that New Brunswick and Prince Edward Island had also suffered heavily. A great many of these native sons were carried away by the railroads at excursion rates—but has anyone noticed that these railroads have at any time offered excursion rates for the purpose of bringing farmers and farm laborers, or useful people of any kind, to the Maritime Provinces? The railway likes the long haul, and therefore it is continually engaged in persuading the Eastern Canadian, or the newly arrived immigrant, to go as far west as possible.

Some time ago it was announced that the C. P. R. was going to do all sorts of things to build up that portion of New Brunswick through which its liaes run. The greatest practical service it could render the province would be to suspend the activity it devotes to the transporting of our people to the western prairies. The railroads owe no duty to the western grain grower that they do not owe to the eastern farmer. All this talk about saving the crop means merely that the railroad needs the money it collects from the passengers it secures through its annual drum-beating about the great harvest.

Some months ago when New Brunswick was discussing immigration, one of the ideas which received much attention from both political parties here was that the time had come to demand for eastern Canada equal terms as compared with the West in as these were influenced by Federal [illegible] The first thing to do is to stop the railroads from [illegible] Maritime Provinces that are [illegible] to the West. It is not good for the Maritime Provinces. It is not even good for the men who go from here to the wheat fields. Moreover, it is encouraging an unsound type of farming in the West. Just now the Grand Trunk is proposing to take 18,000 farmers or farm laborers from Ontario, carry them West and attempt to have them settle there permanently. The [illegible] Citizen, a conservative journal, to make some very [illegible] about this whole question. We, in the Maritime Provinces, are directly interested in the several questions which the citizen raises and which it discusses with considerable penetration.

In many instances those who go on these farm excursions are carried West under false pretenses. Many of them are unable to return to their homes, a majority are subjected to ill-treatment or hardship of one kind or another, nearly all meet disapointment, and no good purpose is served in most cases at least, by the so-called "excursion." New Brunswick has had more than enough of it.—St. John Telegraph.

Peter Tumbledown Says Dairy Farming Does Not Pay.

Babcock Tester and Scales.

Essentials in every Dairy [illegible] Outfit.

The Maritime Farmer Back in its Old Home

[illegible] TIME FARMER from Sussex to St. John, N. B., in October 1911.

[illegible] appreciation of the worth of THE MARITIME FARMER, we who have had a peep behind the scene felt that in order to keep properly in touch with farming conditions we must get [illegible] in the land.

The building [illegible] occupied in St. John was sold and as we were [illegible] decided to bring The Maritime Farmer back to Sussex, its [illegible] and birthplace.

Sussex is the centre of one of the finest farming districts in Canada, where the farmers are enthustasts and where science and practical experience go hand in hand.

THE MARITIME FARMER is now comfortably situated in one of the finest printing offices in Eastern Canada, the building having been especially designed for a print shop for the Kings County Record.

One of the greatest drawbacks we have had to contend with in the past was the lack of a press large enough to handle The Maritime Farmer in quick time so that we could hold our forms open until the very latest moment for the accommodation of our advertisers and to give the latest market reports. This difficulty has been overcome as we have installed a Babcock Optimus flat bed press, with one exception the largest in Canada. We are now able to print sixteen pages of the Farmer at one time instead of eight pages.

The move, we believe, will prove advantageous both to readers and advertisers as we are enabled to carry on our work with higher efficiency and to assume newer and heavier responsibilities.

We extend a cordial invitation to all our friends, old and new, to call and see us in our new home.

R. D. Robinson Publishers, Ltd., Sussex, N. B.

Smothering Out Weeds.

Here is a cheap, easily applied and most thorough method of eradicating quack grass, Canada thistle, etc. Buy at from 50 to 65 cents per roll of 150 feet each, the common tarred sheathing paper and lay it flat over the stubble of the pest cut when in blossom, usually in July or August. The edges should overlap 2 inches and be fastened to the ground with wire pins made by cutting ordinary fence wire into lengths of 6 or 8 inches. Bend one end at right angles and crowd down close to the soil through the lap at intervals of 1½ to 2 feet. This holds the paper securely and excludes air, sunshine and [illegible] kill any and all weed pests.

A vast amount of ill health is due to impaired digestion. When the stomach fails to perform its functions properly the whole system becomes deranged. A few doses of Chamberlain's tablets is all you need. They will strengthen your digestion, invigorate your liver, and strengthen your bowels, entirely doing away with that miserable feeling due to faulty digestion. Try it. Many others have been [illegible] way [illegible] For sale by all dealers.

HORTICULTURE.

July Fruit Crop Report.

WEATHER CONDITIONS

The weather for the past month, while quite favorable for tree fruits, has been much too dry for small fruits in all districts, where these are specialties. While the number of days upon which rain was reported by the Weather Bureau was normal, yet the rain missed certain sections with great regularity. The first part of July may be characterized as dry and hot in the fruit districts. Strawberries have been materially reduced in yield, and raspberries are likely to suffer in proportion.

APPLES.

The prospects of the apple crop as reported last month, founded upon the fruit bloom, are not borne out by the 'set' of fruit. There has been an exceptionally heavy 'drop' even where the 'set' appeared to be fairly good; but in many cases, especially in orchards that bore heavily last year, notwithstanding the full bloom, little fruit is expected. The damage by the Tent Caterpillar, over a wide area comprising the Eastern part of Ontario and Western and Southern Quebec, has been serious. Nevertheless it should be noted that correspondents usually under-estimate the quantity of fruit at this season of the year just as they are inclined to over estimate it on the appearance of the bloom. It is not improbable, therefore, if conditions are favorable, that an improvement will be reported in the season.

Taking 100 as a standard or full crop, the percentages for the Dominion stand at 67 per cent. for Early apples, 69 per cent. for Fall apples, and 65 per cent. for Winter apples. The average, for the Dominion, of all kinds of apples, therefore, would be 67 per cent.

District 1.—The Southwestern Counties have suffered considerably from dry weather and with the exception of the Niagara District, from lack of good culture. Early apples show up best, although the fall and winter varieties still show for a fair crop. The percentage for all apples in this District will be 71 per cent. of a full crop.

District 2.—Early apples are not a feature in this District although a large number of Colverts and Jennettings are frequently harvested. The winter varieties show for 64 per cent. of a full crop. Kings, Spies and Roxbury Russets will be below average, Baldwins somewhat better and Ben Davis standing as high as 83 per cent.

District 3.—There has been a serious falling-off in the prospects for this District, particularly in winter apples, the Spy being short, with the Baldwin, Greening and Stark somewhat better. The Golden Russet shows up well, but the Ben Davis heads the list of standard winter varieties.

District 4.—The ravages of the Tent Caterpillar are responsible for a serious falling-off in the prospects for this District. Early apples are fairly good, but the winter varieties will be decidedly short. One of the chief apples of the District, the McIntosh Red, is reported at only 41 per cent. of a full crop.

Districts 5 and 7.—The reports show a medium crop, with no special features. Fameuse and McIntosh are reported at 85 per cent. and 75 per cent respectively.

District 6.—All correspondents this month report a light 'set' compared with the heavy showing of bloom. The good prospects of last month have not been maintained, and estimates have fallen to about 52 per cent of a full crop. It is likely, however, that this estimate will be increased later in the season. The orchards are particularly well cared for, spraying is quite general, and so far the weather has been favorable. In addition to this, there are a large number of orchards bearing their first crop, so that the aggregate of fruit in all probability will be higher than the percentage would indicate. It is noticeable that the winter varieties have a much lower percentage than the earlier varieties. Gravensteins stand at 63 per cent of a full crop, and this will probably be maintained. Kings and Baldwins are also showing well, while Ribstons and Russets stand somewhat low.

District 8.—A full crop is expected in this district. Being somewhat late, the orchards are not yet at a stage where a report can be made upon the amount of 'drop.' Nevertheless the orchards are looking well, and no adverse conditions are reported.

District 9.—The prospects are not quite so good as reported last month, though correspondents still anticipate 80 per cent. of a full crop. The King and Ribston are reported as dropping heavily. Early apples show even better than the late varieties.

District 10.—A heavy 'drop' is reported, but further thinning will be necessary. The average of the percentages stands at 85. Jonathans are said to have depreciated considerably. The Ribston, Blenheim, McIntosh Red, Golden Russet and Ben Davis all stand high. Crabs are a heavy crop.

PEARS.

Pears have depreciated somewhat during the month. Blight has been worse than usual this season, but

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he used Chamberlain's Cholic, Cholera and Diarrhoea Remedy in his family for fourteen years, and that he has founh it to be an excellent remedy, and takes pleasure in recomending it. For sale by all dealers.

Pruning in June.

For numerous reasons June is one of the best months in which to prune. It is only at that time that it is possible to secure certain beneficial results. Pruning a dormant tree serves to stimulate growth, and the severer it is the ranker the succedding growth.

Stimulating growth is, frequently, just what we don't want to do. Trees are often unfruitful simply because they are growing too fast. All their energies are directed toward the formation of wood cells and in consequence fruit buds are not to be found. Such excessive growth is usually caused by a soil too rich in nitrogen. How can we prune such trees and avoid still more stimulation? By pruning in June, the time of their most rapid growth.

The effect of June pruning is to give a check, a shock to the tree. A tree does not long grow rapidly. May and June mark the most active period, and if limbs be cut off in June the tree seems to realize that it is too late to restore the loss that year. It does, however, heal over a wound at that time quicker than at any other and here is where we find another reason for June pruning. The quicker a cut surface is covered the less risk that germs of decay will find lodgement and work their way into the wood cells. In June the roll of new wood that begins to grow out all around a wound and to cover it, moves faster than at any other time.

Another reason for June pruning is that suckers or sprouts do not form so numerously acound the scars. Heavy pruning in the spring is often followed by scores of these shoots, which should all be removed. This can be done easily and quickly without the use of knife by snapping them off with the fingers when only a few inches long.

Still another and the most important advantage of June pruning is that this is the best way to induce fruitfulness in a tree that has been barren or a shy bearer. When a tree receives a check to growth consequent upon such pruning, it immediately begins the formation of fruit buds. This method is to be preferred to root pruning, girdling the trunk by stripping off sections of bark. Try June pruning on trees that are old enough to bear but refuse to make fruit buds, and you will find it uniformly successful.—L. R. Johnson.

Preserving Fruit to Show.

It is desirable to have it retain the natural color, which is not possible with fruit canned in the ordinary. Of course fruit preserved in the following way is not fit for use as food. The food should be ripe and well colored, but firm and perfectly sound.

For peaches and apples take 95 parts pure water and pour into it five parts formalin. Place the fruit in a jar and pour this solution over it and seal at once, as the formalin will evaporate if left open for any length of time. For preserving grapes use only two parts of formalin and 98 parts pure water.

This rule is not absolute, since very acid fruits will requite an alkali to counteract the acid. A teaspoonful of soda to a two-quart jar will usually be sufficient if the fruit to be preserved contains considerable acid. The regular museum jars can be ordered, though the Mason fruit jars will answer as well, and are usually at hand. —H. F. Grinstead.

REGAL Flour yields the *best quality* and the *utmost quantity* of bread per barrel: white, light loaves, pastry of melting flakiness.

This is simple direct truth.

The New Perfection Griddle

each designed specially for use on the New Perfection Stove.

With these appliances and the New Perfection glass door steel oven, the New Perfection is just as complete and efficient a stove as a regular coal range. Certainly, it is much cleaner and cheaper. Many people use the New Perfection all the year round.

Ask to see this Stove at your dealers. It is handsomely finished. It has fine enamelled chimneys, but-connective. Any cabinet top, drip trays, filler pieces, etc. Made with 2 or 3 burners. Free Cook-Book with every Stove. Cook-Book also given to anyone sending 5 cents to cover mailing cost.

THE IMPERIAL OIL COMPANY, Limited

DAIRYING.

Making Butter.

Butter is produced by churning:—
(1) Ripened or soured cream
(2) Sweet cream
(3) Ripened or soured milk.

PREPARATION OF UTENSILS FOR CHURNING.

1. Churn.—Scald, wash in cold water, scrub with salt, wash salt off, and stand in clean cold water. In summer where ice cannot be procured the churn should be scalded the day previous to churning.

2. Butter-worker.—Scald, wash in cold water, scrub with salt, cover worker with damp muslin, and stand scoop and wooden hands in a bucket of cold water.

PROCESS OF CHURNING.

Ripened or soured cream of .5 to .6 per cent. lactic acid, should have a sharp acid taste and thick velvety appearance. The churning should be done at least twice a week or bitterness is apt to develop.

Temperature of churning.—In winter 58 degrees F. to 64 degrees F. In average summer weather 52degrees F. to 54 degrees F. Cream should be thinned down with water until it runs quite thin off the back of the wooden hand. If cream is too thick it will take a long time to churn because the fat globules are massed together and stick to the side of the churn, instead of moving about freely. Cream should always be strained through a coarse straining cloth into churn and the churn filled only from half to three quarters full. During churning ventilate now and then to allow the carbonic acid to escape. If there is no ventilation the cream will become frothy and difficult to churn. The time usually occupied in churning is from 20 to 35 minutes. Stop churning when small particles of butter appear on the glass about the size of a pin's head, and add one quart of water to every gallon of cream used. The temperature of breaking water in winter should be about 5 degrees below churning temperature, and 8 degrees in summer. After adding breaking water, churn until particles of butter are the size of wheat. Then run off buttermilk through the sieve over which a muslin has been tied. This will prevent the loss of any particles of butter in the buttermilk. Then strain in washing water the same temperature as breaking water, always adding enough water to cover the butter. Revolve the churn several times in the washing water; then run off and add brine. To make brine add 1 lb. salt to 1 gallon of water. The temperature of brine in winter must be 7 degrees below churning temperature, in summer 10 degrees. Revolve several times, and stand for 10 minutes.

ADVANTAGES OF CHURNING TO A GRAIN INSTEAD OF A LUMP.

1. Butter is more easily washed, to remove impurities.
2. Butter can be made firmer, through each granule coming in contact with the cold water.
3. A more even salting is possible as the brine forms a covering over each granule.

After standing 10 minutes in brine remove butter to the butter-worker with a scoop and sieve, and extract moisture.

Pressing, not rubbing, is required when extracting moisture on the butter-worker. To know when the moisture is extracted press the butter between the wooden hands when only tiny globules about the size of a pin's head should appear. The standard allowed is 16 p. c. water. Then weigh in ¼, ½, or 1 lb. lumps; print with the wooden hands, and pack in grease-proof paper ready for market. Making up nicely is a very important part of butter-making, for without good shape and colour and neat appearance, the value will be lessened.

This butter is called fresh butter; for medium and heavy salting salt on butter-worker with dry salt.

Medium salting.—Roll on butter-worker about four times; weigh butter, then add ½ oz. of salt to each lb. of butter roll again; sprinkle salt on butter; roll again twice; cover butter with muslin and stand for 15 minutes. This standing is to allow the water to dissolve the salt, and prevent streakiness. After standing, extract moisture until only tiny globules appear about the size of a pin's head.

Heavy salting.—Roll butter about four times on butter-worker, then weigh. Add salt at the rate of ¾ to 1 oz. to every pound of butter. Roll on butter-worker twice; cover and stand 30 minutes, roll again twice, stand another 15 minutes, then extract moisture.

CHURNING FAULTS

"Cream taking a long time to churn" Causes.—
1. Neglect to ventilate
2. Cream too thick
3. Cream too thin
4. Over-filling the churn
5. Temperature too low or too high.
6. Cream from stale cows.

The remedies are obvious. Thin the cream to the proper consistency; fill the churn only to one-half or at most three-fourths of its capacity. Raise or lower the temperature as required, and do not neglect to ventilate. Cream from stale cows should be mixed with that from fresh cows before ripening.

BUTTER FAULTS.

"Streakiness".—Caused by—
1. The salt being unevenly worked in.
2. Working with the human hand.
3. Churning cream of different ripeness together.

Specks are caused by neglect to strain the cream.

"Rancidity."—Caused by—
1. Under-and over-ripe cream.
2. Overchurning-churning to a lump
3. Dairy utensils.
4. Careless washing of butter.
5. Use of bad salt.

Good butter should be firm in texture, and free from visible moisture, and should present a granular appearance when broken. The flavour should be nutty, and the keeping quality good.

CLEANING UP.

All utensils, churn, butter-worker etc., should be washed in half cold and half hot water, then in scalding water, and dried. The utmost cleanliness must be practised in every operation.

WHOLE OR LOPPERED MILK.

The churning of ripened or loppered milk is very seldom practised since the use of the separator has become so general. Sometimes in small dairies the whole of the milk is set aside daily, and ripened or soured. It is generally kept three days, each day's milking being added to the vessel in which it is being ripened. It should be quite thick and sour before being churned. Owing to the small quantity of fat milk contains as compared with cream it is necessary to churn it 2 degrees higher than cream, or the churning will be greatly prolonged and a loss of fat will take place in the buttermilk. It is always necessary to add butter colouring, as butter from whole milk is much paler than from cream butter. Where there is a great demand for buttermilk, and

Rid Your Cattle of the Fly Pest

With the warm summer days come the yearly torture of domestic animals by flies and other insects—prevent this useless suffering by buying

COW COMFORT

an inoffensive yet powerful liquid preparation that will rid your animals of the flies that swarm about them; destroys lice, ticks, fleas; cures skin diseases, scabs, tetters etc.; cleans, disinfects and removes offensive odors.

You know that animals cannot be healthy when devoured by insects—you know how quickly hogs decline in weight when they are troubled with vermin—by preventing suffering to your cattle you not only perform an act of humanitarism, but assure perfect health to your animals and profit by it in the end.

Sold in gallon cans at $2.00 each, but as the contents of a can is to be diluted in four gallons of water, it makes the price really 40cts a gallon.

a good price can be asked, it is sometimer advisable to churn this whole milk, as the buttermilk is much richer than that from cream.

Sweet Cream.—Butter from sweet cream is sometmes preferred on account of its mild cream flavour. It is not advisable commercially as it will not keep; and is only fit for home consumption and where it is made and churned daily. After separating it should be cooled down and allowed to stand several hours before churning. Sweet cream must always be churned at a lower temperature than ripe cream, or a loss of fat will take place in the buttermilk. It must also be washed very thoroughly to free it from buttermilk, otherwise it will not keep.—Jenny Reid in Journal of Agriculture.

Neutralizing Acids in Over-Ripe Cream.

It is customary in some creameries known as "Centralizers," to neutralize the excessive acid which is found in cream delivered but once or twice a week during the hot weather, then pasteurize or ripen with a pure culture or "starter." In order to obtain some data on the effects of various neutralizers, five experiments were conducted at the O. A. C. Dairy School, in August and September, testing the effects of Baking Soda, Washing Soda, Lime Water and Milklime, when added to sour cream before pasteurizing.

COMMENTS ON RESULTS.

1. The addition of the "neutralizer" had the effect of lowering the percentage of acidity in the cream to a marked degree. Pasteurization of the cream had a further effect of reducing the acidity, probably due to a more perfect chemical action as a result of the process of heating, although pastuerization alone reduces the acidity of cream to a slight extent. This latter effect is probably caused by a freeing of some of the natural lime salts of milk by the action of heat. The acidity did not seem to develop afterwards on the neutralized cream to the same extent as in the normal lots pasteurized and ripened with a similar percentage of culture.

2. In all cases except the one where washing soda was used, the cream churned in less time after partial neutralization of the acid before pasteurizing. To some extent this may have been due to less weight of cream in the churn for these lots. There was also a tendency for less loss of fat in the buttermilk from these lots, as compared with the normal lots.

3. There was also a difference in the percentage of moisture and salt in the finished butter from the various lots.

4. The "overrun" was less in the lots where the cream was neutralized, as compared with the "overrun" from similar lots not neutralized. In the four tests which are comparable, the average "overrun in the normal lots was 16.9 per cent., while the others averaged 13.2 per cent The tendency was for a lower yield of butter in the lots where the cream was neutralized before pasteurizing.

5. There was little or no difference in the average scores for flavor, or in the total scores of the four lots.

6. The results by neutralizing with lime water before and after pasteurization of the cream were not decisive. More experiments on all these points are needed before drawing conclusions.—Prof. H.H. Dean, O. A. C. Guelph.

SHE PAID To Escape These Disks!

We have in our office, this very minute, the letter telling how the plucky woman here mentioned paid her hard-earned money to escape washing these disks.

One Difference Between Tubulars and Others

Letters come to us telling how plucky women pay hard-earned money out of their own purses to escape washing disk-filled cream separators. Here is just such instance: A lady and her husband decided to have a cream separator. He thought only of the price and refused to pay more than the cost of a cheap, disk-bowl machine. Like other women, this lady could not bear the thought of washing 40 or more disks twice a day. She wanted the wonderful

SHARPLES Dairy Tubular Cream Separator

She knew that Dairy Tubular bowls contain only the little piece shown in the right-hand pan and are the only easy-to-wash separator bowls. She also knew that Tubulars have twice the skimming force and skim twice as clean as others—thus paying more every year in extra profits than could be saved through buying any cheap machine. So, to what her husband was willing to pay she added enough hard-earned money from her own slender purse to buy a Sharples Tubular. And now she is one of the happiest, most contented separator users you ever saw.

What greater praise could be given Tubulars than the fact that women so greatly prefer Tubulars that they will pay to escape washing other machines? Ask for Catalog No. 194

Do you want a free trial? Do you want to exchange your old separator in part payment for a Tubular? You can do either.

LIVE STOCK.

Rumination, or "Chewing the Cud."

The phenomenon of cud-chewing, to which singular process the ox and sheep alone of the animals of the farm subject their food, is most interesting to any one who cares to take the trouble to watch it, and, needless to say, its proper performance is of vital importance to the health and thriftiness of the class of stock to which the function belongs.

Why a horse has a comparatively small stomach and a long intestine, and the ox an enormous paunch, three other so-called "stomachs," and a short intestinal canal, why one chews its food a second time and the other does not, is not clear; but it is supposed that the function was developed far back in times when graminivorous animals were harassed by beasts of prey. They traveled in flocks or herds to the feeding grounds, bolted their food hurriedly, and then returned to some place of quiet and safety to chew it at leisure.

There are several theories as to the exact fashion in which rumination is performed, and the relation of the several compartments of the stomach to the process, but the most generally accepted is the following:—Grass, hay and other rough food is, as already described, thrust half-chewed into the rumen, where the mass is slowly and deliberately churned, so that a complete mixing takes place. The essential function of the rumen is to retain the food for rumination, macerate all fibrous substances, and fit them for cellulose digestion. Liquid and pultaceuos matters may pass at once into the omasum (third, or "manifold," stomach) as well as into the rumen (first stomach or "paunch") or the reticulum (second, or "honeycomb,'. stomach), in othes terms, food coming down the oesophagus, which in passing through the rumen forms a singular groove or channel, may enter either of these reservoirs, the destination being determined by the condition in which it is swallowed.

At intervals, determined by the fullness of the rumen and the quietness of the situation, the animal lays itself out to subject the roughly masticated alimentary to a second chewing and, judging from the appearance of contentment assumed by the animal, this seems to be a pleasant business. In doing this, a pellet of food is pressed, by a contraction of the rumen and reticulum, into the oesophageal groove and carried up the oesophagus, by its reverse peristaltic action, into the mouth, the act being termed "fetching the cud," where it is chewed, slowly and complacently, until well mixed with saliva, when it is swallowed again.

THE TIME OCCUPIED.

Colin, by whom, with Flourens, in France, the physiology of rumination has been prncipally worked out, and on whose experiments and observations our knowledge of the process is entirely based, estimates the weight of each bolus cut off by the contraction of the extremity of the oesophagus at 3½ oz. to 4 oz.; that its formation and ascent occupies about three seconds, its remastication about fifty seconds, and its descent after grinding as one and a half seconds. On these data he has calculated that at least seven hours out ol tweaty-four are required for the process of rumination (Smith).

There is no doubt, however, that the time occupied, or the number of chews given to a bolus, varies with the character of the food or its artificial preparation, as we shall presently see, and not only do no two cows occupy the same time, but there is no uniformity of rate or duration in the same animal. It is essential to remember that the process of chewing the cud is one which may easily be disturbed, some individuals being very easily upset. Therefore great care should be taken not to disturb or interfere with animals when chewing the cud.

With reference to what happens after the bolus has been masticated, mixed with saliva, and reswallowed, its course deaeads upon ies state of preparation. It may be returned to the rumen—coarse food may be remasticated several times— but if finely comminuted, and always the fluid portion squeezed out before grinding of the solid mass commences, it is passed along the oesophageal groove, the lips of which contract to form a tube leading to the omasum (third stomach), where it undergoes certain changes that have not been definitely determined, until it finally reaches the abomasum (fourth or true digestive stomach), the only compartment secreting gastric juice, and where the proteids are converted into peptones.

It is important to note that one of the most certain signs of health is the regular and vigorous chewing of the cud, and that

CESSATION OF RUMINATION

is one of the earliest signs of a departure from health, and especially where digestive derangement exists. Cessation of rumination is not, any more than loss of appetite, a diaggostic symptom, but "loss of cud" and "dropping the cud" is invariably associated with improper feeding or functional or organic disease of the digestive organs.

One of the most fertile causes of loss of cud is failure to supply a sufficiency of long fodder. Not only can cattle deal efficiently with a large quantity of comparatively innutritious material, and by persistent chewing get the full value out of it, but a certain amount of roughness or length is essential to rumination. It is not possible to feed the cow in tabloid form, or even on the concentrated stuffs essential in the case of the fast working horse.

THE PULPING SYSTEM.

A quarter of a century ago, when the system of pulping, grinding, and chaffing all the food given to cattle minimun—and a good deal of waste was first introduced, it was hailed with delight as reducing waste to a of roots and hay went on—and unthinking people talked of relieving the the cow of much of the labor of mastication and digestion, just as unpractical people do now about cooking food for stock.

Many farmers and dairymen laid down expensive plans for carryiog out these processes—power-driven chaff cutters, corn grinders, cake breakers, and root pulpers—but it was very soon found that cattle so fed suffered from loss of cud, and consequent indigestion— mainly chronic "hoven."

Many dropped the system like the poverbial "hot potato," and allowed their costly machinery to rust, but the wiser sought for the cause, and it was found to be due to an insufficiency of long fodder. In other terms, either the food was too short to permit of its being formed into a

Dr. Morse's Indian Root Pills

are just the right medicine for the children. When they are constipated —when their kidneys are out of order —when over-indulgence in some favorite food gives them indigestion —Dr. Morse's Indian Root Pills will quickly and surely put them right. Purely vegetable, they neither sicken, weaken or gripe, like harsh purgatives. Guard your children's health by always keeping a box of Dr. Morse's Indian Root Pills in the house, They [1]

Keep the Children Well

Amatite ROOFING

Why Practical Men Demand Amatite

ROOFING that needs paint every two years can't hold the market against Amatite—which *needs no paint whatever.*

Practical men know the great advantage of a roof that *needs no painting.* They know what a nuisance the painting is. They know how much it costs. They know how liable they are to neglect to paint their roofs at the proper time.

Painted roofings are waterproof only where the paint is. Amatite is waterproof all the way through.

Amatite is sold in the usual convenient rolls of 110 square feet with a smooth lap where the mineral surface is omitted, so as to secure a tight joint. Nails and cement are packed in the center of each roll.

Free sample and booklet on request to nearest office.

International Poultry Food

SAFE FROM CHOLERA

keeps chickens healthy — prevents Cholera —and makes hens lay.

Feed them right and they will feed you right. Give the roosters, hens and little chicks a daily feed of INTERNATIONAL POULTRY FOOD and you will have fine plump Broilers for your own table—plenty of eggs to eat and sell—and vigorous pullets that will develop into good paying hens.

"International Poultry Food" is a grand preparation, and no one raising fowls can afford to be without it, as it is a sure cure and preventative for Chicken Cholera and other diseases and it greatly increases the production of eggs. It does not cost anything to feed it, because chickens will lay more than enough eggs to pay the cost.—V. V. HOLDEN.

International Poultry Food

is a true poultry tonic and food. It prevents and cures Chicken Cholera, because it keeps the chickens well. Thousands of farmers, breeders and fanciers depend on "International" to keep their chickens strong and vigorous, and make hens lay.

Sold by dealers everywhere, on our spot cash guarantee, at 25c., 50c. and $1 a box. Write for a free copy of our $3,000.00 Stock Book. 72

THE ST. JOHN BUSINESS COLLEGE

S. KERR Principal.

folus for regurgitation, or it was already so finely comminuted as to need very little secondary mastication, and consequently received only a small and insufficient mixture of saliva.

As we have endeavoured to show, digestion is not a simple mechanical process, bou a series of chemical changes brought about by the action of the sectretion of various glands, of which those having their ducts opening into the mouth, and which are excited by mastication, are of great importance.

It was found that the feeding of the chaff in long lengths—not less than 2½ in., easily accomplished by taking a knife out of the machine, or providing one good meal daily of long hay, or straw—enabled the cud to be easily "fetched," and ensured that it was properly "chewed," and effperience goes to show that, employed in this way, the system of pulping and chaffing the food can be practised without the slightest fear of indigestion resulting.

"DROPPING THR CUD."

the equvalent of which in the horse is popularlr known as "quidding," means the dropping from the mouth of partly-chewed food, considerable quantities of which are sometimes found in the crib or on the ground.

This takes place in diseases of the mouth and dental irregularities, rendering mastication painful, and is also one symptom of certain sub-acute forms of indigestion dependent on bad and innutritious food. Sometimes the contents of the rumen are actually vomited, the reverse peristalsis permitted in the bovine oesophagus in "fetching the cud" favouring vomition.

In describing the structure of the oesophagus in the bovine, reference was made to the fact that the tube is composed of red muscle throughout and that it differs from the horse, in which the terminal portion is composed of involuntary muscle, and is so narrow, and always closely contracted, that if cut off close to the stomach the contents do not escape. This is one of the several reasons why horses do not vomit, and conversely why cattle sometimes do.

The first thing in any case of "dropping the cud" is to examine the mouth. In young animals, dental changes, and particularly the persisting crowns of desiduous molars, cause pain in mastication, or there may be disease of the buccal membrane, of the tongue, &c., for example, as commonly occurs in cases of actinomycosis.

In dropping the cud on account of indigestion the animal is generally unthrifty, with depraved appetite, irregular bowels, and hidebound.

A cathartic dose of saline laxative with a change of diet, as indicated in all cases of irregularity in rumination associated with digestive derangement.

Fall Calves Best.

The best skim milk calves are those born in the fall of the year. Their young life is spent at a more favorable season, declares a successful farmer who has worked the thing out.

The milk they get will be in better condition than the milk which the spring calf will get. They will not be annoyed by the flies and the hot weather. They will not have a chance to eat grass when so young.

A calf is like a child; he will eat things he likes, often to the deterriment of his general health. The fall calf, if properly handles, will go onto the grass in the spring and will make good gains and profit for his owner at the end of a year far ahead of a calf born in the spring.

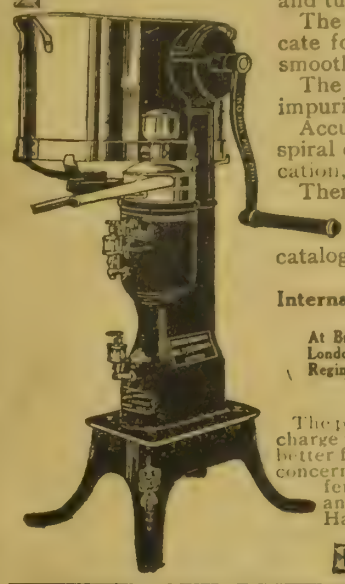
A Close Skimmer and Built to Last

THERE are two features that make a separator a good investment: close skimming and durability. Easy cleaning and easy turning are important, but not as important as the power to get all the butter fat and keep on doing it for many years.

I H C Cream Separators will make good under the most severe skimming test. If you will compare their construction with that of any other separator you will see why. Extra strong shafts and spindles, spiral cut gears, phosphor bronze bushings, thorough protection against dirt or grit getting into the working parts, and perfect oiling facilities, are the features that make these separators good for long service.

IHC Cream Separators Dairymaid and Bluebell

are close skimmers and built to last, and at the same time are easy to clean and turn. The reasons are these:



The interior of the bowl is entirely free from intricate forms of construction. Every part has a plain, smooth surface, to which dirt and milk do not adhere.

The dirt arrester chamber removes the undissolved impurities from the milk before separation begins.

Accurate designing and fitting of all moving parts, spiral cut gears, convenient crank, and thorough lubrication, make these separators easy to turn.

There are many other features worth your consideration. Ask the I H C agent handling these machines or write the nearest branch house for catalogue.

THE HORSE.

Rope Horseshoes Used in Germany.

Owing to the rapid increase in the mileage of streets paved with asphalt and wood blocks and to the congestion of traffic in the large cities it was found necessary to afford greater safety for horses, to prevent their slipping and enable them to come to a quick stop. This has been attained by fitting them with "rope" horseshoes. These shoes were first manufactured some 25 years ago, but it is only during the last decade that the industry has grown to large proportions.

Various forms and shapes of shoes are used. Some are opened at the back, like an ordinary horseshoe. Others are closed; and often, besides being closed there is a bridge or crosspiece joining the two sides. When this is the case the bridge is constructed like the rest of the shoe, inclosing a tarred rope. There are usually eight nail holes in each shoe; and in order to strengthen the bottom, and especially to make the nail holes more secure, the walls af the groove are sometimes reinforced by braces. The space in the centre of the shoe is often covered over with various kinds of inserts to protect the frog from injury. The latest novelty, which has been adopted by the Royal stables, is the insertion at the back of the shoe of a block of wood into which stiff bristles have been driven. This is an additional preventive against slipping. When the ground is covered with snow a special ice plate is inserted in its stead.

It is customary to use special nails with long heads in attaching the shoes to the hoof. When the long-headed nails are used, it is possible to drive them in and to extract them without taking out the rope. These nails, which are driven between the auter side of the groove and the tarred rope, also help to hold in the rope. The tarred rope wears down simultaneously with the rest of the shoe, and it is only on rare occasions that the rope must be withdrawn and new inserted. This change can be made without removing the shoe. The average life of a rope horseshoe is six to eight weeks.

The advantages and disadvantages of the rope shoes can be summarized as follows:—Advantages—They are light and comfortable for the horse; they help to prevent slipping; they break the concussion and deaden the sound of the hoof. Disadvantages—The driving of the nails requires more care; the blacksmith must have in stock a larger quantity of shoes of various shapes and sizes. Great care has to be taken in the preparation of rope horseshoes not to overheat the iron nor to hammer it when too cold, otherwise it will crack on the anvil.

In addition to the plain tarred rope horseshoes there are shoes in which rope interwoven with wire, wood, rubber, copper, wirework, rush, etc., is used. These are heavier, somewhat more expensive, and less practical than the plain rope shoes, and therefore have not become so well established.

Horses in Summer.

The care of horses during the hot weather has been placed before the readers of the Humane Pleader, the organ of the Toronto Humane Society, because it finds that "more men fail in the care of their horses during the hot weather than at any other time of the year." The substance of the article follows:—

Remember that cleanliness always travels side by side with kindness. The horse, like yourself, is subject to the troubles, diseases and pains of life. Therefore be merciful.

GENERAL RULES.

1. A clean stable. No manure should be allowed to gather. The cleaner you keep the stable, the better for the horse and yourself.

2. Screens on doors and windows. Plenty of fresh air (most important) can thus circulate and flies can be kept from your horse.

3. Sponge your horse oftenest where he sweats the most. Rub him dry. Fluffy towels are good and cheap. Do not use the hose on your horse.

4. Cleanse eyes and nostrils, and occasionally the ears.

5. You cannot be too careful of the hoofs. Never allow yourself to leave the stable at night without thoroughly cleaning the lower portions of the legs and fetlocks. Where clay can easily be obtained, it will pay to pack the hoofs at least three times a week, making the clay into a stiff paste.

6. Watch the shoulders. If, while working your horse, you find the shoulders getting sore, far better for the horse, and yourself, to stop working for a half hour, rub down the shoulders, and apply the following hardening lotion:—Tannic acid, 1½ oz.; powered alum, 2 oz.; carbolic acid, 1 dr.; water, 1 qt.

7. Occasionally, during the day, sponge the head, neck and eyes.

8. Do not fasten a sponge on top of the head, unless you keep it wet.

9. The straw bonnet is of some service, if there are ventilation holes through the sides. If the holes are not there, the use of the bonnet increases the temperature at the top of the head, just where it is leastwanted.

10. Give your horse small quantities of water many times during the day.

11. When your horse comes in from a day's work in the hot sun, give him a chance to "cool off" before putting him into the stable, and give him plenty of water in small quantities. Then put him into the stable and feed. The above is a particularly helpful method during the hot humid weather, such as was experienced in this country for some days last summer. If you fail to treat your horse as just advised, he is liable to start out tired the following morning and may collapse before the day's work is done.

12. Give your horse a chance to roll. It is oftentimes better than a dose of medicine for him.

13. If you are not too selfish, and are not too far away from grass, take your horse out for an hour on Sunday, and let him have a nibble.

14. If your horse is off his feed, give him a few carrots, or a bunch of clover, then two quarts of crushed oats mixed with a little bran and moistened, and add a little salt or sugar.

15. Do not rush your horse in the hot weather.

SUNSTROKE.

16. Watch your horse. If the perspiration pours from his body and he breathes short and quick he is in danger. You must then act quickly. The continuing symptoms are these; The perspirations drys up, the horse staggers, falls down, becomes insensible, and death will take place in about half an hour if he is not relieved. He has suffered sunstroke. Treatment—As soon as your horse begins to show excessive perspiration and short, quick breaths, send for a veterinary, but do not wait for the veterinary to come. Do something for his relief yourself. Get him out of the shafts at once, and into a shady place. Take off all his harness. Give him lots of water in small servings. Sponge him all over, and shower his head, neck, shoulders and legs. (Do not use the hose unless you spray the water from the nozzle, letting it fall like rain.) Give him four ounces of aromatic spirits of ammonia in a pint of warm coffee. It will likely pint of warm *not hot) water, or a be of great assistance to put a bag of crushed ice on the top of his head and neck. If he is so insensible that he will not drink, wash out the mouth a few times. Instead of the spirits of ammonia, a half-pint of whiskey in a quart of water may be given. Give your horse lots of time to recover.

17. Keep the harness in good condition, but be sure that the inside of the harness is free from dirt. Wash it often. The inside of the harness is more important than the outside, in this respect. Pay particular attention to the collar and the pads. The sweat and dust should never be allowed to harden on the surface of the pads. Roughen the surface by using the curry-comb.

18. Keep in a handy box a supply of castile soap, a number of clean towels, carbolic acid (a small quantity to be used as a disinfectant in the water when washing sores or wounds) and borax, also a cleanser and healer.—Advice by Toronto Humane Society for City or Country.

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distempr, Glanders, Spavins, Pink Ey, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

POULTRY.

Preparing For Winter Eggs.

The time to prepare for winter egg production is in the summer, when the hens are laying constantly and naturally. The winter egg basket will be empty if the hens are not properly fed, regardless of everything else. It is not reasonable to suppose that proper feeding will produce prolific laying in winter, regardless of everything else, and it will not, but it will largely increase the productiveness of hens of even indifferent qualities, and hens of the right breeding and raised under right conditions may be made to lay well throughout the winter without injurious forcing through the feeding of stimulants, which are not as a rule recommended by experienced poultrymen.

It is essential to winter productiveness that the hens moult in good season, and they will usual y do so after having been on range all summer, without any special inducements, but it is a good idea to confine them for a week about the first of August, and and feed them on half rations during that time, still providing the usual variety of food. This also applies to hens that have been confined in yards. After a week of half feeding, the hens will be given their usual amount of feed, there being a double portion of linseed meal in the dry mash, which will loosen the bowels and start the new feathers to growing, the old ones having been loosened by the previous change in diet. This will produce a quick moult, usually, the hens feathering out rapidly without losing a great amount of flesh. After the double portion of oil meal has been fed a week, the normal method of feeding should be resumed, and a liberal supply of green food and beef scrap should be provided until the moult is completed. All that is then necessary to make the hens lay fairly regularly in winter, providing that the birds are descended from a good strain of winter layers and have been well bred, is to give them the food they need, and enough of it throughout the winter. The essential thing is to provide summer conditions as nearly as possible, throughout the winter season.

This is simple enough, but it requires a certain amount of work every day. There must be plenty of fresh air, fresh water and sunlight in the pens at all times when not prevented as to sunlight by the weather. There must also be efficient substitutes for the bugs and worms and the great variety of green stuff that the birds find on the range in summer, and there should never be a lack of either. These conditions provided and there will be eggs every day in the year. The best quality of commercial beef scrap is the best substitute for the bugs and worms, so-called blood meal and other meat preparations aside from the clear scraps being of considerably less value. Ground green bone, when perfectly fresh and wholesome, is good, but should be used only occasionally, say once or twice a week, when it may be substituted for the scrap. Of course, small pieces of meat from the table and similar refuse will make a very acceptable variation of the meat ration. This may be left in the pens and the hens will not consume more than is good for them.

The variety of green stuff is not as easily supplied, but still there is little difficulty in supplying all the essential elements for egg production. Sprouted oats are very good, but there is no one thing as good for continual daily use as alfalfa meal or the hay cut into short lengths when thoroughly dry. This may be mixed dry with the dry mash, of which it should form one-third, or it may be

(Continued on page 749.)

Buy I H C Wagons for True Economy

YOU cannot farm without a wagon any more than you can keep house without a stove. It is something you need every day. You work it harder than anything else on the farm, and when the old one wears out you have to get a new one at once.

Figure out how many bushels of corn, wheat, or oats, or how many bales of cotton it takes to keep you in wagons, and then see how much you save when you buy a wagon that lasts longer than the average.

It is an easy thing to do, even though all wagons which are painted alike look alike. The difference in wagons is underneath the paint. It is the material and workmanship, as well as the paint of I H C wagons

Petrolia **Chatham**

which make them the best wagon investment for any farmer.

We tell you plainly what material goes into every part of our wagons, and we want every purchaser to convince himself before buying, that when I H C wagons are advertised as having birch hubs, maple axles, and long leaf yellow pine box bottoms, these are the materials actually used.

Such care is taken in the construction of the I H C wagons, and in the culling of the materials which go into them, that when a wagon reaches a farmer's barn, that farmer has one of the best wearing, easiest running farm wagons that skilled labor can make or that money can buy. There is no need to speculate in buying a wagon. Wear and tear and length of service are the points to go by. I H C wagons are made for nation-wide uses, with special features adapted to local conditions. Wherever sold they are right, and ready for use in that locality. The I H C wagon agent in your town sells the wagon best suited to your neighborhood. Ask him to go over the wagons with you. Ask him for I H C wagon literature, or write the nearest branch house.

When I Have Gone Away.

When I have gone away, dear heart,
And left the scenes of earth behind
Each link that forms of life apart,
The higher, larger life to find,
Bring spring-time flowers fresh and fair
To lay above my place of rest,
And let them whisper to me there,
The flowers that I love the best.

I know not now, dear heart, the ways
Of that fair land of mystery;
How souls through the eternal days
Grow sweet and strong, and glad and free.
But this I know: That love will last,
Nor ever unresponsive grow,
And precious memories of the past
Will bind me to the hearts below.

Bring flowers for sweet memories' sake
And lay them low where grasses wave,
And they a deathless chain shall make
That reaches on beyond the grave.
And past the torch of blight and chill,
In fields whose fadeless flowers grow,
Living and luring, loving still,
Believe dear heart, that I shall know.—Julia E. Abbott in Maine Farmer.

Out of the House of Bondage.

It was a windy March dusk when Dr. McGruder pushed open the door of Dr. Pemberton's big, cheery, study and stalked up to the fire, pulling off his big driving gloves. His grizzled sandy beard was blown sideways by the wind, and one side of his face was beaten red by it.

"Its a tearer," he remarked. "Been out?"

The little minister had stooped to poke the fire into a brighter blaze; now he looked up, his fine old face, with the delicate humorous puckers about the mouth, illuminated by a sudden leaping flame.

"No, James," he said mildly; "no It was my sermon day, you remember. I never go out upon my sermon day—if the wind blows."

The doctor's eyes twinkled. "Aye, man, ye're canny," he retorted. "Ye almost conveence me, once in my age, that I might be willing to trust my soul to ye. If ye were one of these little whiffets that thought every time a child cuts its finger it was an affleection of Providence that ye were called to pray over, I'd have no faith in ye. But a man that knows enough to keep in when the wind blows—"

The old minister turned, the poker suddenly motionless in his hand.

"James," he asked, "what's happened?"

"There ye go!" the doctor grumbled. "I hoped ye'd outgrown it—at your age! Maybe ye think ye can set a broken limb better than I can! Who's taking care of the sick people in this town—you or I?"

"I reckon, James," the little man retorted, "we're doing it together. Haven't you got that beaten into your Scotch head yet?-"

The doctor laughed and stretched his arms, a huge, towering figure among the shadows. Then he said: "Jane Campell had a stroke this morning. I think she'll get her speech back, but I doubt she ever walks again."

"Jane Campbell!" the minister echoed. "Jane Campbell! Why, she was up here last night about the treasureship of the Ladies' Aid. It wasn't her business, but it had gotten into a muddle, and she was itching to straighten things out. She—James, you can't mean Jane Campbell!"

"What are you up to now?" the doctor growled, his shaggy brows drawing together over his keen eyes. "Leave her alone, man—she's settled for the night. The wind's blowing forty miles an hour' and with your throat—"

"I guess Joe isn't settled for the night, is he?" the old man returned, stamping into his arctics. "And my throat's my own, if half the town does seem to think it has a mortgage on it. Besides"—pulling an old mulberry-colored muffler out of a drawer—"I've got this contraption. Poor Jane it will be terribly hard for her, with only Joe."

"It may be "poor Joe," the doctor said dryly. "Hi, there, Andrew!"

The little minister started guiltily, and, pulling the mulberry-colored "contraption" out of his pocdet, where he had been absent-mindedly stuffing it, he tied it elaborately about his throat.

"Now I'm ready," he announced. "going to drive me down, James?"

"A kind, thoughtful host, it is"—the doctor addressed the fire. "Won't even give a man time to get thawed out when he comes in from a twenty-mile trip—"

But Dr. Pemberton was already out of hearing down the windy garden-path.

Poor Jane Campbell lay in her immaculate room, the light turned low, her eyes full of bewildered struggle, looking out into the strange world in which she had traveled so far since morning.

As Dr. Pemberton entered, Joe rose from a chair at the foot of her bed. He was a big, gentle, broad-shouldered fellow, as slow in every movement as his mother had been swift, and the bewilderment in his honest gray eyes almost equalled the dumb pathos in hers. He wrung the minister's hand silently.

"It—it's awful to see her so," he said, choking over the words.

"Don't you go to worrying, Joe," his friend returned cheerfully. "The doctor will bring her round all right. Probably this was the only way to make her take a rest." He crossed over to the bed and covered one of the heavy, helpless hands with his. "Don't you worry, Jane," he repeated. "You haven't tumbled out of the Lord's care."

There was no answering comprehension in the troubled eyes—only the pitiful dumb terror.

The old man returned to Joe.

"Who's going to sit up with her?" he asked.

"I am," Joe replied.

"But, man, it may be months. You can't take care of her alone."

"There have been a lot of folks over," Joe explained, "but I sent them away. Mother always dreaded having people around her things. I'll make out somehow, Dr. Pemberton."

From that nothing could shake him, and the minister, beating his way home against the wind half an hour later, coat open and mulberry muffler flying like a flag under one ear, meditated wrathfully upon an old, old theme—the obstinacy of the best people.

Joe Campbell's task was lightened of its worst bitterness, however, sooner than any one dared hope. In less than a week his mother's speech came back, and, more slowly the use of her hands. There matters stopped. Jane Campbell, the most indefatigable woman in town, the master-spirit of every enterprise, was chained for the rest of her life, however long or short, to the rack of a sick-bed. And nobody saw the whole situation so clearly, down to each detail of it, as Jane Campbell herself.

"Now, what," the old minister mused one warm April day—"what will Jane do? Human beings don't change their nature by putting in prison. Jane Campbell always was yeast, and yeast she'll be to the end of her days. She can't stay bottled up without something's happening. She's got to find an outlet somewhere. Lord keep Thy servant from presumptious sins; if there's anything more presumptious than thinking Thou hast forgotten how to manage human hearts, I don't know what it is."

But already Jane Campbell had planned her role. Not consciously, of course—that is, not consciously ac. knowledgeing it as a role. Few of us play at the same time audience and stage. So Jane Campbell, gripping with small determined hands a man's life, said with a gentle pathos that so long as Joe needed her she was going to try to live. It was not much living to her, but Joe, poor fellow, would be so lonely after she was gone.

And indeed it was true. Joe had always loved his mother, and now, full of pity over her broken days, nothing that she wanted was too difficult for him. So when the terrible selfishness which is the constant lurking foe of helplessness began to grow upon her, no suspicion of it touched his heart. When Molly Blake made her nervous, Joe instantly declared that Molly must go; and when the two or three other experiments—all that the village possessed in the way of "help"— each in turn proved impossible, it was the most natural thing in the world that he himself should quietly take up the burden of the housework, getting up at five o'clock to cook breakfast before going down to the shop, and hurrying back at noon to get dinner. It seemed to Joe perfectly right and natural that his mother should use his life to fill her own broken measure, and day by day Jane stifled her conscience till she began to believe it too.

Of course all this came about gradually—so gradually that it was some weeks before Dr. Pemberton realized what had happened. When he did, though he had been down only the afternoon before upon his regular weekly visit, he trotted down again the next morning, as soon as Joe had gone. And the moment he entered the door Jane understood why he had come. He began bluntly:

"See here, Jane— what's this I hear about Joe's doing all the work? It isn't right—It isn't right. Joe's too fine a fellow to be turned into a housemaid."

Jane sighed. "I know it, Dr. Pemberton," she said. "Ther's nobody knows so well as I what Joe is. I can't sleep nights worrying over it. But what can I do? There's no one we can get."

"There was Nellie Wright" Dr. Pemberton reminded her, looking down at the toes of his boots.

Jane's eyes filled with tears. "Oh, Dr. Pemberton, wecouldn't keep her! Why, the dishes she brought me my meals in were so dirty that I couldn't eat a thing. I don't ask or expect much now, but I do think I have a right to clean dishes. I'd rather starve than eat anything Nellie Wright cooked for me."

"Well, of course, I didn't know," Dr. Pemberton said hastily. "But there were others. There was Molly Blake, now."

"But Molly couldn't turn around without breaking things," Jane protested plaintively. "She broke one of my Parian vases that Mr. Campbell's aunt gave me when we were married, and an eau de cologne bottle I had from girlhood, and—"

"Well, well!" Dr. Pemberton interrupted bruskly—people always had to interrupt Jane Campbell. "I suppose you know better than I do, Jane and that I'm a meddling old interloper; but there are things that are worth more than all the Parian vases and cologne bottles in the world, and a good son is one of them."

Jane sighed again, but tenderly this

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

SUFFERED EVERYTHING

For Years, Restored To Health by Lydia E. Pinkham's Vegetable Compound.

Canadian women are continually writing us such letters as the two following, which are heartfelt expressions of gratitude for restored health:

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound and never found any medicine to compare with it. I had ulcers and falling of womb and doctors did me no good. I suffered dreadfully for years until I began taking your medicine. I also recommend it for nervousness and indigestion." — Mrs. HENRY CLARK, Glanford Station. Ont.

Chesterville, Ont. — "I heard your medicines highly praised, and a year ago I began taking them for falling of womb and ovarian trouble.

"My left side pained me all the time and just before my periods which were irregular and painful it would be worse. To sit down caused me pain and suffering and I would be so nervous sometimes that I could not bear to see any one or hear any one speak. Little specks would float before my eyes and I was always constipated.

"I cannot say too much for Lydia E. Pinkham's Vegetable Compound and Liver Pills, for there are no medicines like them. I have taken them and I recommend them to all women. You may publish this testimonial." — Mrs. STEPHEN J. MARTIN, Chesterville, Ontario, Canada.

CHALLENGE BRAND WATERPROOF COLLARS

Look like linen—feel like linen, but outwear a dozen linen collars. No laundry bills—a little soap and water only required to keep them fresh and clean.

"I was cured of diarrhoea by one dose of Chamberlain's Cholic, Cholera and Diarrhoea Remedy," writes M. E. Gebhardt, Oriole, Pa. There is nothing better. For sale by all dealers.

time. "Joe is a good boy," she said. "He quite spoils his mother." And Dr. Pemberton knew himself worsted, as people generally were with Jane Campbell, and trudged back home disheartened. Even at the parsonage there was small comfort waiting, for when he pushed open his study door Dr. McGruder looked up from the old sleepy-hollow with his wickedest smile.

"Converted Jane?" he asked pleasantly.

"Sometimes," the little minister declared with a fervor that made his friend chuckle under his great beard—"sometimes I think that women like Jane could get around the Angel Gabriel."

But when he pulled up another chair and, sinking wearily into it, stared into the fire in a discouraged silence, the doctor's voice changed.

"Poor Joe!" he commented.

"Poor Jane," Dr. Pemberton answered gravely.

April melted into May, and May into June, and Joe told Dr. Pemberton that they were getting on "first rate." Then, all in a moment, something happened.

Rose Henderson!

It was a late June afternoon, in that loviest hour just before sunset, when the shadows were long across the meadows and bird escasties were rising everywhere, that Joe Campbell, going home from his shop, saw Rose coming down the village millener's steps. Others besides Joe might ve been pardoned for finding the picture an eminently pleasant one, for Rose was tiny and trim, with a face that flushed and paled adorably and eyes like a brown brook in the sunlight, and she wore a ruffled pink gown that made her look like the incarnation of her name. To poor Joe, his soul suddenly summoned to his eyes by this most startling vision, she became instantly She—the One. Of course, after that one startled moment, Joe wrenched his eyes away and went soberly on down the street, with, however, a blush that rivaled hers flaming in his face. But before ty-four hours had passed he had learned that Rose Henderson was an orphan, and had come to be Miss Parson's assistant. Within three days (heaven knows how, for social manoeuvring was not among Joe's acquirements) he had contrived to meet her. Sunday he walked home from church with her.

The news reached Jane the next day. With consummate skill she not only extracted every shred of information from her caller, but left that worthy neighbor quite crestfallen because, apparently, she had brought no news after all. But after she had left, Jane's poor hands twisted fiercely in the bed clothes, and her eyes grew dark with suffering.

"He's all I've got!" she cried passionately to some unanswering One. "It isn't fair to take him away from me. He's all I've got, and I won't let him go!.'

Then she lay still, thinking. It might pass over, of course—going home from church once with a girl isn't a commital. But in her heart she knew that Joe wouldn't get over it. After all, just then there was nothing to do but wait.

The next Sunday it rained, and Joe going hopefully to church, returned grave and absorbed. She wasn't there, Jane divined exultantly. If it would only rain for three or four Sundays! But it didn't; the third was a day full of splendid beauty, and Joe returned looking as if some of the summer glory had been spilled into his eyes, and all of the afternoon he wandered about wrapped in a blissful haze.

For several weeks things went on so; then came a Sunday when, towards twilight, Joe became restless. He fidgeted about the room till poor Jane was almost wild. Finally he spoke.

MOUNT ALLISON University

COURSES IN ARTS SCIENCE AND THEOLOGY

Annual Session 1912-13 opens THURSDAY, SEPT. 19.

Many Scholarships and Prizes are offered.

For information regarding courses of study, degrees, scholarships, prizes, affiliated, relations, expenses, etc., send for calendar.

Incoming students wishing residential accommodation, should give earliest possible notice.

RECAME SO WEAK FROM DIARRHŒA

Had To Quit Work

Diarrhœa, especially if left to run any length of time, causes great weakness, so the only thing to prevent this is to check it on its first appearance. You will find that a few doses of Dr. Fowler's Extract of Wild Strawberry will do this quickly and effectively. Mr. Jno. R. Childerhouse, Orillia, Ont., writes:—"When in Fort William, last summer, I was taken sick with diarrhœa, and became so weak and suffered such great pain, I had to quit work. Our manager advised me to try Dr. Fowler's Extract of Wild Strawberry, so on my way home I bought a bottle, and after taking four doses I was cured. We always keep a bottle in the house. We have also used it for our children, and find it an excellent remedy for summer complaint."

Price 35 cents. When you go to get a bottle of "Dr. Fowler's," insist on being given what you ask for, as we know of many cases where unscrupulous dealers have handed out some other preparation.

The genuine is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Cheap Fares to Toronto Exhibition

In connertion with the Canadian National Exhibition at Toronto which will be held this year from August 24th until September 9th, the Intercolonial Railway will give very low excursion rates which will give the opportunity to many to visit the "Queen City" on the occasion of its great annual fete.

The Toronto Fair is the largest and most attractive of annual exhibitions in America, and this year new permanent buildings have been constructed and its extensive boundaries enlarged by new boulevards. Aside from the attraction of the exhibition a visit to Toronto at this season is sure to be enjoyable and with the very low rates prevailing it will be possible for persons of moderate means. The going dates are: August 22, 24, 25, 27, 28 and September 4 and 5. A special rate from all states will prevail on August 23 and 25, and on September 3rd. All tickets are good to return September 11th, Maritime Province travellers will have their choice of two through vestibuled trains, the Ocean Limited and the Maritime Express, both of which connect at Bonaventure Union Station, Montreal, with the through Grand Trunk Railway trains for Toronto. It will be well for intending travellers to apply early for reservations. Particulars will be given by the local ticket agents.

"Were all medicines as meritorious as Chamberlain's Cholic, Cholera and Diarrhoea Remedy the world would be much better off and the pescentage of suffering greatly decreased," writes Lindsay Scott of Temple, Ind. For sale by all dealers.

"Mother, I was thinking if you didn't mind, I'd go to meeting tonight. I could get Amanda Gates to come in and sit with you."

For a second it seemed to Jane that her heart stopped beating, but she made herself speak.

"Poor boy!" she said.

Joe was at her side at once. "Why mother," he cried, "what do you mean."

"Its so hard for you to be tied down with a half-dead mother," she sobbed. "It almost kills me to be such a burden to you, Joe." ...

"Mother, don't!" Joe cried sharply. "You've—you've no right to say that, mother." He actually choked over the words. All the chivilary that was in him was always stirred to a passion of pity whenever he thought of her helplessness.

Jane's small hand found his and clung to it.

"I didn't mean to hurt you, Joe. But to think that I keep you from —rom things! To think that, if the —from things!) To think that, if the time comes when you want to you couldn't ask any girl to take up such a burden! But it may be only a while, Joe, and I know you won't be sorry when it's over. I—I haven't been so well this week.-'

Joe did not go to church that Sunday night, nor did he again go home with Rose. A worn look came into his young face, but he was as tender as always to his mother. It was as a reward, though, in the curious way in which we hoodwink our consciences She ascribed it to quite other motives, that one Sunday evening in August Jane insisted upon Joe's going to church. He needed to get out more, she said; it was worrying her. He could not please her so much as by going.

So Joe, to please her, went. If either of them could have forseen what would happen—

Rose Henderson was there— Joe saw her the instant he went in. It had been three weeks since he had even met her on the street, and the poor fellow's heart gave a thump, and for one blissful moment he forgot; then it all came back, and he knew that he had no right to look at her. Yet in spite of his resolve, his eyes kept wandering back, like homing birds. Rose's pretty little face was grave and full of brooding thoughts, but only Dr. Pemberton was in a position to see, and his kind old eyes were too dim. So the two young things sat through the service and did not hear a word of it, and after it Joe started to hurry home alone. Then Rose turned and saw him, and in a flash the sad, drooping face was all illumined with joy; and Joe, dazed, bewildered, incredibly happy, was at her side.

"May I go home with you, Rose?" he asked.

And Rose, trembling and flushing, answered honestly. "I'd love to have you, Joe."

Out in the darkness, Rose's small hand on his arm, the two were absurdly shy. It was Rose who finally broke the silence.

"I—I was afraid you were offended, Joe."

"Offended!" Joe cried. Logically considered, it was no answer, but it satisfied Rose.

"It—was so long since I'd seen you," she said, with a happy tremulous laugh.

Joe drew a hard breath, "I guess you don't know how I've wanted to see you," he said.

"How," Rose asked in a hurried little voice—"how is your mother?"

But not even the thought of his mother could not stay Joe's delirium then. He answered her, but he did not know what he said—the only things he was conscious of were the face under the wide hat and that timid touch upon his arm. He did not even realize what Rose was saying, though she kept talking—per-

New Vitality For You

USE THE

Free Coupon

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; every thing else will come. My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

haps because she was afraid of silences.

When they reached Miss Parson's Joe went up to the door with her. The house had a tiny piazza, hidden from the street by a great syringa bush. As Rose put out her hand to say good-by, suddenly, before either of them knew what had happened, Joe leaned down and kissed her.

They drew apart, Rose trembling, Joe shocked.

"Oh, Rose," he cried passionately, "I had no right!"

But little Rose looked up at him bravely. "I guess—I wanted you to," she whispered.

Joe caught the small fluttering hands and held them fast.

"Oh, I love you, love you, love you!" he cried but there's—mother."

Rose's shining eyes, confident with her joy, met his. "It will come right somehow," she said. "I don't mind any thing so long as we—know."

Yes, they knew, assuredly. And that night, like the straight-forward fellow he was, Joe told his mother.

(Continued in next issue.)

Flour and Breadmaking.

(Continued from last issue.)

QUALITY IN FLOUR.

The various kinds of flour dealt with in the preceding chapters comprise all those in general use throughout this country. They vary very much in strength, due to the circumstances which cause variation in the quality or strength of the wheat, the milling, the grade, and the kind of flour. Unfortunately our knowledge of the ultimate composition of the constituents of flour, or the various intricate changes that take place in the making of bread, is not complete enough to make it possible for us to determine by chemical analysis the best breadmaking flour. Within certain limits it is an easy matter to tell which flour will make the best bread. For instance, the flour from hard spring wheat is usually granular, or gritty; and, when squeezed in the hand, does not readily pack, leaving the imprint of the fingers, whereas the soft flours do. The hard, or strong, flours absorb more water and give a better yield of bread. They also have more gluten, which gives them greater expansive properties. In general, the hard flours are usually spoken of as the bread flours and the soft flours as the pastry flours But when we come to distinguish between tne different kinds of strong flours, the feel, or the appearance, alone is not sufficient to base a correct judgment regarding the merits of the two flours, nor will chemical analysis aid us materially.

The baker likes a flour that will absorb a large amount of water, yield a large loaf of a desirable shape, with good colour and texture. Such a flour is usually spoken of as a strong flour, but if we look deeper and attempt to define "strength" in flour, we find many conflicting views. Jago defines strength as the capacity of a flour for absorbing water, and treats separately the quality of size, shape, colour, and texture. Humphries' and Biffin's definition of strength is the "capacity for making large, well-piled loaves." This definition suggests that the primary factor is the size of the loaf, the other factors being shape and, perhaps, to some extent, texture.

If we try to explain the factors that influence the volume, texture, and shapeliness of a loaf of bread, the conflict of views is even more in evidence. The oldest idea suggested that, because of the tenacity of the gluten, the carbon dioxide produced in the dough by the action of yeast was retained, and caused the dough to rise. No doubt a large amount of gluten is frequently associated with large volume and good texture, but there are apparently other factors

Get Busy With a Baler

IF you have clover, timothy, prairie grass, or alfalfa, it will pay you to bale it. Loose hay is hard to place. You cannot sell it easily and you cannot ship it at all. It is the hay that is baled which is in demand in the high-priced city markets. This is the hay upon which you make your profits.

The difference between what it costs to bale hay and the increase you get in price per ton, gives you a bigger margin of profit on your work than anything else you do on a farm. You can bale easily from 8 to 16 tons a day and under certain conditions, several tons more. Baled hay can be made as much a big cash crop to you as your wheat, corn, or oats. All you need is the right kind of hay press. There is money in owning an

I H C Hay Press

An I H C pull power press in either one or two-horse style, or an I H C motor press with a 3, 4, or 6-horse power I H C engine, will do the work required on any farm cheaper, quicker, and with less attention than any other hay press so far designed.

It has taken years of field testing to make these presses the best that you can buy. They are that now. The horse power presses have greater capacity than any other horse press of equal size. They are lighter draft and easier on the horses. The step-over is the lowest and narrowest made. They have an adjustable bale tension, which insures compact bales. They are equipped with a roller tucker to turn in all straggling ends, thus making each bale neat in appearance.

I H C motor presses consist of a bale chamber and an I H C engine mounted on substantial trucks. The bale chamber of the motor press corresponds in size to the bale chamber of the horse press—14x18 inches, 16x18 inches, and 17x22 inches. No time is lost in setting up the machine. It can be moved easily from place to place, backed to the stack or barn, and started to work at once. The engine does not need a man to watch it and there is no danger from sparks. When not baling hay, the engine can be detached. Two extra wheels, an axle, and a belt pulley are furnished, so that with a little extra fitting, you have a regular portable I H C engine ready for business 365 days each year. You can operate a small thresher or corn shredder, saw wood, shell corn, grind feed, pump water, generate electricity, or run a cream separator. You thus purchase two useful machines in one. There is profit in the hay press and unlimited work in the engine.

Hay time is drawing near. Be prepared for it. Drop in and see an I H C local agent in your town, or write the nearest branch house for a catalogue.

108 Canadian farmers will receive cash prizes (twelve in each Province) in our big

1912 FARMERS' PRIZE CONTEST

WE held a contest last year in which 36 prizes were offered. This year there will be three times as many prizes (108) and therefore three times as many chances for you to win one of them. You do not have to use a large quantity of cement to win a prize. Many of last year's prize-winners used comparatively little cement.

THE contest is divided into three classes and in only one of these ("Class 'A'") does the amount of cement used count in deciding prize winners. Class "B" is for the best concrete work the same makes of reference. Class "C" is for sending in the best and clearest description of how any piece of concrete work was done.

THERE will be four prizes: First $[illegible], Second $25; Third $[illegible]; Fourth, $[illegible] in each class in each Province. Thus you will compete with other farmers in your own Province, and not with those in all parts of Canada. This gives you the best possible chance to win a $50 prize.

IT COSTS NOTHING TO ENTER—There are absolutely no "strings" to this offer. There is no entry fee or red tape to bother with. You cannot lose, because the improvements you make of concrete in connection with the prizes will more than be worth their cost. We have a book, *"What the Farmer Can Do With Concrete,"* that will give you all the information you need about the use of concrete on the farm. It will be sent to you free, postpaid, on the condition precedent that you enter the Prize Contest. Ask for particulars to-day. Just say "Send me your book and particulars of the 1912 Prize Contest," on a post card and mail it *to-day*. Address Publicity Manager,

Canada Cement Company Limited, 503-561 Herald Bldg., Montreal

Suffered With Nerve Trouble

FOR TWO YEARS

IMPOSSIBLE FOR HIM TO SLEEP

Mr. Chas. W. Wood, 34 Torrance St., Montreal, Que., writes:—"For two years I had suffered with nerve trouble, and it was impossible for me to sleep. It did not matter what time I went to bed, in the morning I was even worse than the night before. I consulted a doctor, and he gave me a tonic to take a half hour before going to bed. It was all right for a time, but the old trouble returned with greater force than before. One of the boys who works with me, gave me half a box of Milburn's Heart and Nerve Pills. I took them, and I got such satisfaction that I got another box, and before I finished it I could enjoy sleep from 10 p.m. until 6 a.m., and now feel good."

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by the T. Milburn Co., Limited, Toronto, Ont.

that influence the result, for there are many cases in which the flour with the highest content of gluten does not give the largest loaf. Attention was called to the fact that some glutens were soft and flabby, while others were firm and tenacious, and attempts were made to ascertain the quality of glutens by determining the relation between the weights of wet and dry glutens, their expansion power under the influence of heat, the proportion of gliadin to glutenin, which together make gluten, etc. But none of these methods have been entirely satisfactory. Recently it has been suggested that it is not the ratio of gliadin and glutenin, but the absolute amount of gliadin which gives strength to the flour. This also has been discredited. Finally, an entirely new theory has been suggested, i. e., that the size of a loaf is not so much dependent upon the quality or quantity of the gluten as upon the amount of sugar contained in the flour, together with that formed in the dough by diastatic action, and that shapeliness, and probably gas retention, are dependent on the physical properties of the gluten as modified by the presence of varying proportions of salts.

From what has been said, it is evident that our knowledge, or lack of knowlehge, of the chemistry of flour and breadmaking is another instance of the fact that many of the most common materials and everyday operations around us are the least understood. Frankly, we do not know enough about chemistry of flour, or of the changes that the various constituents undergo in the process of breadmaking, to devise any system of chemical analysis that will give conclusive and satisfactory evidence of the strength of flour for breadmaking purposes. Therefore, the only available method of determining the relative value of flour for bread purposes is by actual baking trials.

In all our baking trials nothing but a little sugar, salt and lard, in addition to the yeast and water, was added to the flour. In order to bring out the full expansive power of the flour, a rather large quantity of yeast was used. The conditions were kept as uniform as possible, but each loaf was placed in the oven when it had risen sufficiently and the general appearance indicated that it was ready for baking.

(Continued next issue.)

FLORICULTURE.

"I have a lot of plants to bring in the house this fall," writes a Chatham inquirer: "When shall I commence to repot and take them in and how shall I water them?"

The last of August or the first of September are the right times to take up and repot plants for fall and house blooming. More care is necessary in watering the plants, especially newly potted plants, as, if overwatered, the soil is apt to get sour at this season and lay the foundation of disease at the same time. Let no plant in active growth dry out. Plants heavily root-bound are not easily injured by heavy watering. Do nor forget to give plants all the fresh air you can. The neglect of this is soon seen in slender drawn stems and lack of color in both foliage and bloom.

Aphis and red spider should be closely looked after now as closed rooms and a still dry air just suits them and if not checked will soon destroy plants. Keep the air moist if possible, by evaporating water or spraying. Moist air is death to red spiders and tobacco smoke or infusion controls the aphis.

Slow growing plants, such as palms, etc., even if heavily root-bound, should not be repotted until spring and any plants that can be safely repotted now should be placed in only one size larger than the pot in which they now grow.

Please tell me what to plant in my garden this fall, to give me bloom before I plant my annals in the spring?

Put in a quantity of hardy plants this fall. They will give you a quantity of bloom next summer without any care and be a permanent fixture in your ground. Peonies, Larkspur, Campanulas, Rudbeckias, Aquiliguias, Pinks, Forget-me-nots, Iceland Poppies and dozens of others, all of which you can find in Goold's Price List, and on his grounds, will be a source of delight for years. They are practically no trouble as they come up season after season. They sow their own seed after they are once planted and will winter well with a very little protection in the fall.

Reader, of St. Stephen, writes: Will you be kind enough to let me know what causes Narcissus leaves and buds, where the plants are well up in the spring, to wilt and give no bloom? I have a young plant of Spirea, will it be difficult to keep during the winter?

I fancy that the Narcissus bed is not well drained. If grown in pots, lack of drainage would cause the same effect. Kindly give particulars of method of cultivation, etc. The Spirea kept somewhat badly last winter where not well protected, but as last winter was so extraordinarily severe that could hardly be taken as a criterion. However, it would be wise to protect with some mulch about the roots and some brush around the top.

Dr. de Van's Female Pills

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. **Dr. de Van's** are sold at $5 a box, or three for $10. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Colic, Cholera, and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an excellent remedy, aad takes pleasure in recommending it. For sale by all dealers.

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition.
It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

Mercantile Assurance Association
P. O. Box 317
Halifax, Nova Scotia.

Prizes Offered by the Canadian Seed Growers' Association For Selected Seed.

Official notice is given by the above organization that substantial prizes in the form of cash and special trophies, are offered for seed grown in the province and exhibited at the next Annual Winter Fair or Provincial Exhibition. The date of that Exhibition will be made public later.

In addition to the regular prizes offered to members of the Association, special cash prizes are offered to boys and girls between 12 and 18 years of age, for Exhibits of Spring Wheat and White Oats. A sweepstakes prize in the form of a beautiful gold medal donated by Dr. Jas. W. Robertson, is also offered to the boy or girl having the best Exhibit of oats in the Maritime Provinces, Quebec and Ontario and wheat in each of the Provinces of Manitoba, Saskatchewan and Alberta. Each of these exhibits is to consist of a sheaf which must be at least 6" in diameter at the band, and a gallon of threshed grain. The plants of this sheaf should be selected by hand from the field before the crop is cut.

Those proposing to compete for these prizes should arrange at once to make the necessary selections and should always write to Secretary, Canadian Seed Growers' Association, Ottawa, Ont. and obtain a copy of the prize list rules and special arrangements regarding the transportation of exhibits.

Now is your chance boys and girls; even if you don't happen to win a prize the experience you will gain will increase your chances next time.

The Greatest Exhibition of Eastern Canada.

In five weeks, or to be exact, on the 11th. of September the 16th. Annual Exhibition of Nova Scotia will open at Halifax.

Every effort is being put forth by the Commission to make this the best of all fairs held in the Provinces. Special attention has been given to the various departments of the Exhibition and from the large number of inquiries for extra prize lists a large number of entries are anticipated in all classes.

Arrangements have been made with the different railways and the very low rates which have been in force will be continued this year.

The amusement programme can unquestionably be said to be the best that has ever been presented to the patrons of the fair. Seven afternoons Racing Programme, bringing not only our Maritime horses but as well, entries from the United States and upper Provinces. Between the heats of the Horse Racing on three days will be the foot races for the Maritime Colleges, as well as those open to all amateurs in the Province.

Seven of the best Vaudeville acts have been secured headed by "Cedora" in the Golden Globe and the famous "Flying Jordans."

Two aviation flights daily, not a flying machine, but one af the CURTISS Biplanes, concluding the evening's programme with a gorgeous dispaly of Fireworks.

Entries in all classes close on August 24th.

Use only the Best.

Don't breed from any birds that do not come up to the standard quality. The breeders should be best obtainable, and should be strong, vigorous and full of life and stamina. Birds that are deficient should never be used, and all cripples, undersized, puny birds should be discarded. If like begets like, you want the best. Make this your rule and live up to it.

MAXWELL'S

HIGH SPEED CHAMPION

Easiest running and most satisfactory washing machine made in Canada. Can be worked with side crank as well as top lever. Red Cypress Tub and the whole top opens up. Wash day is the easiest day of the week when you wash with the Maxwell "High Speed" Champion.

JEWEL FOOD CUTTER

is just what you need for your kitchen. So much easier, quicker and more convenient than cutting up meat, etc., with a knife.

"Jewel" is superior in every way to imported food choppers, and being made in Canada, costs less.

FAVORITE CHURN

makes the most delicious butter you ever tasted. It's real "quality" butter—that is a pleasure to eat.

Both hand and foot levers and roller bearings, enable a child to churn with the "Favourite". All sizes from ½ to 30 gallons

Preparing for Winter Eggs.

(Continued from page 741)

steamed and led while still warm and damp, in which case only what the hens will consume quickly should be fed at a time. The dry method of feeding is very satisfactory and saves a good deal of work on the part of the attendant.

Alfalfa may be bought prepared for use, or the thrifty farmer who has the right kind of soil may raise it and prepare it himself at a great saving. Alfalfa will grow readily on dry sandy ground, where the damp soil begins not less than 15 inches below the surface, but it will not thrive in damp, marshy soil. It requires perfect drainage to make a good alfalfa field, and intervale land is entirely unsuitable for it. Clover prepared in the same manner is also very good, and is the best substitute for, although not quite equal to, alfalfa.

The best vegetable food that can be grown is the mangel-wurzel beet, which may be fed whole or chopped, and raw, as may carrots, red beets, raw potatoes and parsnips. Turnips should be cooked, and carrots if fed liberally will affect the color of the egg, as well as the flavor. Cabbages are good, but should not be fed too liberally, and for that matter this is true of all vegetables. Too much alfalfa or clover cannot be given, for the effect is beneficial in whatever quantity consumed, and the hens will not eat more than they want. Liberal quantities of these vegetable foods and grasses should be stored up for the winter, during the summer and fall, and the lawn clippings, if carefully dried and stored away in bags for winter use, will be found of much value.

The thrifty poultryman will also, in autumn, gather as large a store of dried leaves as circumstances will permit, to add to the litter from time to time, in cold weather. No matter how cold the weather, hens will not exercise for the warmth afforded, and the only way to keep them busy, as they must be if eggs are to be numerous, is to scatter the feed in deep litter. This is where the leaves will come in handy. Of course, straw and hay are equally valuable, but the leaves cost nothing but the labor, and the litter is much better if it is made up of a variety of suitable by-products of vegetation.

The condition of the poultry houses is an important factor, both in summer and winter, though it is impossible to take as good care of it in the winter as in the warm weather, for obvious reasons. Whitewashing cannot well be done in winter, but at least one coat should be applied when it may readily be. One coat in the spring and another in the fall is still better. If the floor is of earth, as it may well be where there is a good under drainage so that there can be no moisture, the litter should be entirely removed and the earth deeply spaded at once in warm weather, while the birds are absent on the range. If lice are prevalent or there is a suspicion of red mites, the whole premises should be thoroughly and effectively renovated and disinfected. This may seem like quite a task, but all these things are essential to winter egg production, and the only way to obtain the highest prices and the greatest profits is to attend to all these details, and attend to them thoroughly. Those who go to this trouble, if trouble it is considered, will be well repaid for their work. There can be no success without labor, and this is particularly true with regard to poultry, but as is usually the case the reward amply repays the effort.

The time has arrived when it will be well to look over the growing chicks, separating the cockerals from the pullets, and paying special attention to the birds which will soon be put in the laying pens, that they may in no way be hampered in their growth. The early hatched pullets should lay well all winter, and they will unless adverse conditions retard their development. They will lay earlier when raised by themselves than when subjected to the annoyances of the young cockerals. The birds should be divided into separate flocks as soon as it is possible to determine the sex.—H. L. Goodwin in Maine Farmer.

An Interesting Plow Catalog.

We have just received a copy of the Cockshutt Plow Co's. Farm Implement Catalogue. It contains a full list of illustrations and descriptions of the various styles of plows they manufacture.

The Cockshutt line is handled in the Maritime Provinces by the Frost & Wood Company. See your nearest Frost & Wood agent to show you a copy of the catalogue. It will give you an insight into the various kinds of plows, etc., that the various soils and soil condition require.

Shoe for Trotting Horse.

To induce a horse to trot or to change the gait from pacing to trotting the services of an expert driver are required. It is largely a matter of training, though much depends on the breeding of the animal and the conformation of the leg. Shoeing with a four calked shoe is helpful in some cases in forming the trotting habit. The front shoes must be heavier than the hind and may be from 10 to 15 ounces according to the size of the horse.

NATIONAL SECURITIES CORPORATION LIMITED

Confederation Life Building, Toronto, Canada.

What Profit Did You Make Out Of Your Cattle Last Winter?

Feeds were very, very high. Figure it out now. If your profits were large or small, you will be only too pleased to increase them this Winter.

Mill Feeds will be as high, if not higher this Winter than last. If you are feeding your Cattle say, four quarts of Middlings to a feed, you can take away two quarts of Middlings, add a quart of MOLASSINE MEAL and get far better results. It will increase the flow of milk in your Milch Cows and fatten your Cattle more rapidly. In the same proportion, this applies to any other Animal you are feeding.

A SUGGESTION:— If you have not fed MOLASSINE MEAL, buy some now and convince yourself by trying it on one or more Animals. There is no doubt whatever but you will be convinced and you will use MOLASSINE MEAL in good quantities during the coming Winter. MOLASSINE MEAL is made in England and fed the world over.

THE MARITIME FARMER, St. John, N. B.

July Fruit Crop Report.

(Continued from page 734.)

even apart from that the 'drop' has been considerable, and the crop will be only moderate. The Kieffer and Bartlett are showing best. In British Columbia pears will be somewhat lighter than was expected last month but yet a good crop.

PLUMS.

The depreciation in plums has been somewhat marked. The prospects this month are for a crop somewhat below the medium, especially in the heavy marketing varieties. On the whole the crop in British Columbia is good, although much better in the Interior than on the Coast.

CHERRIES.

Cherries have not yielded as well as was expected. A fair crop of early cherries is being marketed. Many varieties of the sweet cherries are decidedly short. The Black Tartarian and Windsor show about half a full crop. Sour cherries are a heavy crop in British Columbia; sweets only medium.

SMALL FRUITS.

The dry weather of the last two weeks materially shortened the strawberry crop and emphasized the unfavorable conditions generally. Raspberries are likely to be a short crop, partly on account of the unfavorable conditions last year and partly owing to the dry weather of the present month. Currants, red and black, do not appear to suffer to the same extent on account of the weather. Blackberries will be decidedly short; the percentage for District 1 stand at 49. In British Columbia, small fruits have been a very heavy crop, but unfortunately the berries were soft and prices were extremely low in consequence of overloading the nearby market.

TOMATOES.

Tomatoes started late but are growing well. The depredations of the cut worms appear to be serious in many districts, and it is quite probable that the crop will not be quite up to the average.

INSECTS.

Correspondents continue to report the ravages of the Tent Caterpillar. While the most serious infestation is in eastern Ontario, southern Quebec, and New Brunswick, yet there are sporadic infestations in all parts of Ontario. The infestation is over so large an area that it becomes a matter of serious import as to whether it will be repeated next year. The moths are now flying freely and the egg clusters are being deposited.

Correspondents have mentioned no special infestation of other insects that manifested themselves during the past month. Codling Moth is not feared as much by growers as formerly, and many orchards that have been sprayed systematically for a few years are now practically free from this pest. A few growers in the Niagara district report that the Rose Bug will reduce their crop one half at least. The injuries caused by the Rose Bug are confined almost exclusively to the lighter land.

We have received many specimens of apples with a small portion eaten out of one side. This is in all probability the work of the Green Fruit Worm, and it appears to be particularly prevalent in District 6. The injury itself is slight, but as the apple grows the wound makes a depression, and so the apple that would be a No. 1 becomes a No. 2 or No. 3.

FUNGOUS DISEASES.

Apple scab is beginning to show itself quite freely in District 6, and unless orchardists continue spraying their fruit apples may show considerable scab. The weather is not at all favorable to the development of scab in Ontario. It is mentioned in District 9, but it is not more prevalent than usual.

There's a merchant in your town who sells Sherwin-Williams Paints and Varnishes—the line that includes a high-quality paint or varnish for every use on the farm or around the home. Go to him for paint advice.

SEND FOR OUR FREE BOOK ON "HOW TO BUILD RURAL TELEPHONE LINES"

YOU do not need to know anything about company organization or telephone line construction to start a telephone company in your own community. "How to Build Rural Telephone Lines" will tell you absolutely everything you need to know. When you have read this book you will be amazed at the simplicity of the whole proposition and wonder why you and your neighbors have not had a telephone system of your own long ago. Sooner or later someone is going to start a telephone system in your neighborhood. Whether you or one of your neighbors chances to be that "someone," you owe it to yourself to be fully informed on the subject.

We Send This 100-Page Illustrated Book Only on Request

THIS book contains seven chapters of detailed information on the construction of rural telephone lines, abounds in photographic illustrations and diagrams and deals with every vitally essential fact as does no other book in existence. Remember this book has cost too much money to prepare to send it out haphazard. While we will be glad to send you a copy, we will not do so until you ask for it. If you are interested in the subject send us the coupon and we will send you one copy of this volume free by return of mail.

Let Us Teach You How To Start Your Own Telephone Company

THE full details of company organization are described in this book. Mutual and stock companies are explained fully so that you can go out among your friends and neighbors and show them just exactly what has to be done.

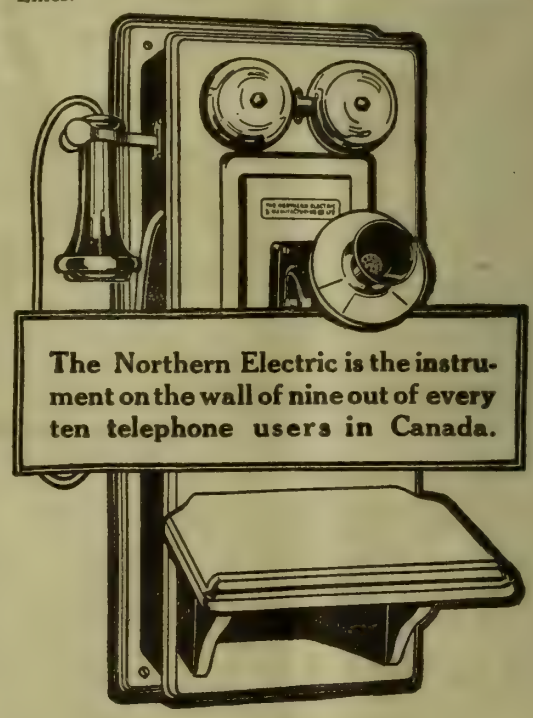
Let Us Show You How To Build The Line and Put In The 'Phone

THE expert advice of high salaried telephone engineers is back of you in every detail of your line construction. With the help we give, you do not need to employ expert linemen but can keep down the cost by doing your own construction work. One chapter of our book alone shows thirty-seven diagrams and illustrations dealing with this branch of the work. On request we will also tell you of your provincial regulations, what your government demands and what it will do to help you.

Take Free All Our Experience and Knowledge

LET us show you how to get the movement started so that your community can have a rural telephone system and you a telephone on your own wall. We offer you freely all the necessary information and our entire experience is at your disposal for the asking. Send us the coupon now and get your copy of "How To Build Rural Telephone Lines."



The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

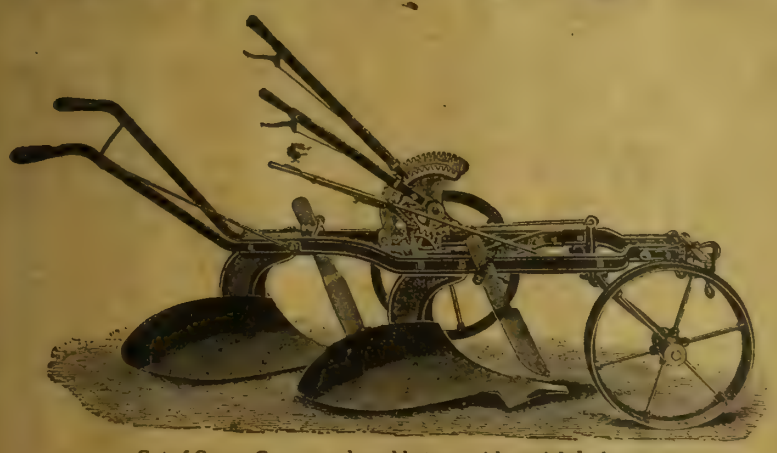
Plow Early

and you not only have easier plowing but a much better yield next harvest. The longer rest given your soil by early plowing, the better conditions for seeding at the earliest date next year.

WE show two excellent Frost & Wood Plows, for swift, deep work. This famous line has been made in Canada for 80 years. Quality and design are in keeping with the prestige and experience behind the name "Frost & Wood.

F. & W. "Crown" Gang Plow



Cut of Crown Gang ong board bottom with straight colters.

This shows the famous "Crown" Gang, fitted with sod bottoms and straight colters. Note the strength of standards, which are bolted to a strong frame of braced channel steel. The "Crown" and two horses only, can often double the work possible with a hand plow in a day on light soil—three horses will handle the "Crown" in the heaviest land. With a "Crown" Gang you can do your plowing in half the time.

The levers for adjusting and lifting are easy to operate. The rolling colters prevent clogging. Every modern device is found in the "Crown" to speed your plowing when every day counts.

Remember, stubble bottoms or rolling colters can be fitted to your "Crown" Gang, making it perfect for all kinds of work. Write us for full particulars.

F. & W. No. 6 Plow

Cut of No. 6 Plow.

Here is a neat, well finished plow for either sod or stubble work. It is one of the Frost & Wood favorites. Note the strong I-beam with low arch, and the medium-length handles, long enough for heavy sod work to save arm strain, and short enough to make a sensitive, easily-guided implement for fast stubble plowing. Write us for name of nearest agent and other details.

Frost & Wood Plows win Results

SEND FOR CATALOGUE Write us to-day for name of nearest agent, and our fine catalogue of implemements and harvesting machinery. A post card will do. These plows are nearby, ready to go in your fields on a day's notice. Learn where you can get the Frost & Wood line.

FIREPROOF COW STALLS

DO YOU SEE THESE CUTS?

They show the barn on the Boys' Farm and Training School, Shawbridge, Quebec. It was built last year and equipped with 30 BT Steel Stalls. On April last fire broke out and devoured every vestive of material that would burn, leaving only the concrete walls, floors and BT Stalls. Mr. Matthews, Principal of the School, writes: "I am very glad I put in your Sanitary Steel Stalls. **ONE DOLLAR** makes them as good as ever after the fire. Had we put in wood stalls they would have been a total loss, and in burning they would have destroyed the floors." But that is not all.

THE STANCHIONS SAVED THE COWS

In a moment every cow could be released from the BT Stanchions. Thirty could be freed from the Stanchions while three would be if tied with chains. With cement floors and Steel Stalls the stable burnt slowly. Wooden stalls would be ablaze like a furnace before a single cow could be saved.

The Boys' Farm and Training School is located at Shawbridge, Quebec, near Montreal, and Mr. Mathews, the Superintendent, tells us that it now has some 60 city boys that it is training in Farm and Garden work. It is certainly doing splendid work in getting the boys back to the land. The first cut shows the new barn they built in 1911 and equipped with 30 BT Steel Stalls. The second cut shows the ruined barn after the fire. The third cut shows the BT Stalls. They went through the fire practically uninjured.

A WISE INVESTMENT

The BT Stalls stood the test. Made of Steel they neither burn nor rot. In fact they are indestructible. Surely when you consider this point alone, you will say they are a good investment. Remember, too, their cost is no greater, taking all things into consideration, than that of the wood stalls.

Further, they will save you in many ways. Write and let us tell you about them. We cannot tell you much in the space we have here.

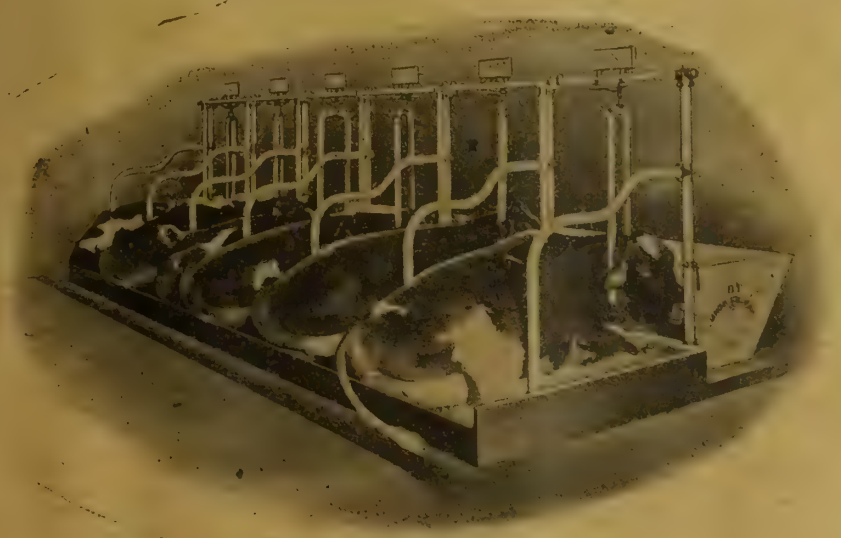
They Make Your Stable Bright and Clean

With Steel Stalls your stable is bright. The open construction of the stalls allow the sunlight to reach every corner. It permits a free movement of air throughout the stable. This abundance of fresh air and sunlight will do more than anything else to prevent disease among your cattle.

The benefit to the cow is indeed one of the great advantages of steel stalls. A cow tied in a BT Stall and Stanchion has the maximum freedom consistent with keeping her lined up in her stall. She can card herself on almost any part of her body. Tied centrally in her stall she is free to lie down on either side. She can freely get up or down, but at the same time she is prevented from moving backward and forward in her stall so that she can be lined up on the cattle-stand and all droppings go into the gutter, not on the cattle stand. That means clean and comfortable cows, and cow comfort means increased production.

Easily Set Up

You can do it yourself. In two hours you can set up 20 BT Steel Stalls, and as soon as the cement is dry your stable is ready for the cattle. Isn't that better than buying expensive lumber and posts, getting it dressed, hiring expensive carpenters and boarding them for days while they put in your stable? You can remodel your stable yourself if you use BT Steel Stalls. From our book on stable construction you get complete information as to how to lay cement floors—the best measurements for stalls and how to set them up quickly and properly.



GET OUR BOOK ON STALLS

Steel Stalls are not all alike. Last year the Dominion and several Provincial Governments built some 20 barns in different parts of Canada, and every one of them was equipped with BT Stalls and Carriers. Why? Our book will tell you. It shows how BT Stalls lessen absortion, do away with the principal causes of big knee, ruined udders and many other injuries which cows are liable to. You will see how our individual mangers save feed—prevent overfeeding and underfeeding. You will also learn how the exclusive features on the BT Stalls mean dollars and cents to you, by giving greater comfort and protection to your cows.

A barn is a permanent investment—don't undertake building it without getting the latest information. Our catalogue is free. It will surprise you how little it will cost to equip your barn with BT Stalls. Fill out the coupon now and let us tell you.

Write us about Fireproof Cow Stalls Use the Coupon

ARRANGE YOUR BARN RIGHT

At a cost of over $2,000 we have produced a book on stable construction. It tells how to build a diary barn from start to finish. It shows how the upper structure should be built, and saves much money over the ordinary methods of framing. It gives the latest and best system of ventilation, which has been carefully prepared by J. H. Grisdale, Dominion Agriculturist. It gives barn plans approved by the best dairy authorities, tells how to lay cement floors properly. It gives proper measurements for manger, cattle-stand and gutters for any size or widths of barn.

This Book is Free. Write us for it. Fill out the Coupon.

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage . . You Can Leave Him. . .

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., Principal Agricultural College, Truro, N. S.

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Colic, Cholera, and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an excellent remedy, and takes pleasure in recommending it. For sale by all dealers.

FLORICULTURE.

In answer to A. A. M., I would say that the rubber plant leaf enclosed has evidently been attacked by insects, either by red spider or trips, although none remain on the leaf, and the portion attacked by them afterwards filled with a fungous growth. Wash the foliage once or twice a week with very weak soapy water using a soft sponge or cloth and then rinse them with clear water. Keep the air of the room in which the plants are situated moist and spiders will not trouble them.

Fancy leaved or Rex Begonias like a night temperature of sixty degrees with fifteen degrees or more higher during the day. They also like a north window with strong light but no sun, moderately moist soil and good drainage. Repot when well root bound and avoid water standing on top of foliage. A light, rich soil is the most suitable, if soil to be used is heavy mix sand enough with it to make it light as the fine, soft roots cannot penetrate a hard, compact soil.

Growers who wish to raise their own annuals from seed and those who wish early blooming plants should always sow about the first of March for plants that will be set out in June. They should be transplanted early from the seed flats into boxes and they will be strong enough to withstand the change of transplanting if given all the sun and air possible. Transplant them from seed flats as soon as second so-called leaves show.

Be sure to press the seeds firmly down after planting and covering and never let them dry out, especially while germinating. Soil for seeds should be light but need not be rich. The soil into which the seedlings are transplanted should be light and rich. If you cannot get light soil and have to use a heavy soil, cover your seeds with dry fine sand instead of heavy soil.

It is a grand idea to pack away some sand and soil in your cellar this fall for spring use.

Very few seeds such as Lobelia petunia can be pressed into the soil lightly and left without any covering material until seedlings are coming up. They do not need light and sixty degrees is about the right temperature for the hardier seeds while germinating. As soon as the seedlings commence to show through the soil give all the light and air you can. Plants thus cold-grown are much stronger and resist disease better than plants raised in heat, unless the warm-grown plants have had a careful hardening off before planting. Some of the hardier seeds may be planted in the ground this fall if correspondent has not room for all these boxes in the spring.

H. A. of Chatham and R. O., of Rothsay send the following inquiry in regard to the rose.

Is it hard to propagate the rose? Can one who is new at garden work do it?

Ans. The propagation of the rose when grown in the home or under glass is very easily done, good judgment only being required in selecting wood that is in a prolific condition. To those who have had no experience I would say that, as a rule, a cutting taken two or three buds below an open rose bloom is a good condition to strike. Cut with a sharp knife in an oblique direction, strip off all leaves except the set attached to the top bud and then insert the cutting in the sand filled cutting box described in these notes. Wood that has made good growth, without producing bloom at the extremity also makes a good cutting and in summer is often the best wood to use as it is not so sappy as the blooming growth. If kept in a temperature of about sixty degrees these cuttings will root in from twenty-five to thirty days.

For roses grown in the open air different methods of propagation must be used as it has been found that cuttings from open ground plants will seldom root when placed in sand or soil to propagate, no matter how well the wood is matured, the cuttings being almost certain to drop their leaves and blacken. Many theories have been advanced as to why they will not propagate, but why is not really known.

If cuttings are taken from open-ground roses, either hardy or tender varieties, after the wood is matured in late autumn and placed in moist sand or soil kept at a temperature of not over forty degrees and not allowed to freeze heavily, a large percentage of them will root in from three to four months so as to be safe to use. By this method of treatment the calloused or rooted cuttings must' if potted or boxed, be kept at a temperature not exceeding forty-five or fifty degrees of heat until they root, it gives a higher temperature they will die. The best method for his stock of out-of-door roses is by the amateur to follow in increasing layering. This process consists of taking a shoot of the rose preferably a well matured one of the year, bend it carefully to the ground and at the point where it will most easily come in contact with the soil, make a cut derside or side of the branch half way through, then draw the knife up the middle of the shoot for an inch. Put a thin bit of wood in the split so the wood will remain separated and then scoop out a shallow place in the soil immediately under the cut place and bury the cut portion of the shoot in the soil and press firm so it cannot move. Then cut a fair sized turf and place it over the layered portion to assist in keeping it uniformly moist. Water it in very dry weather. In from three to five weeks the cut portion will have calloused and will throw out roots so that in autumn, by cutting the shoot from the parent plant the new plant may be removed. By placing a pot filled with soil in the ground under the rose plant and layering in the pot instead of in the ground the plant will be already potted and no check will be received when it is removed. Layering is also the best method for amateurs to follow in propagating all classes of hardy plants and shrubs. Currants and gooseberries may be rooted in the same way.

Many of the hardy and half hardy plants and shrubs will, however, strike from growth but as a rule all the hard-wooded varieties, will fall from cuttings if dormant wood is given the time and cold treatment described.

In propagating tuberous rooted plants such as Dahlias, Begonias, Anemonies, etc. from cuttings the treatment is the same as given in propagating soft-wood plants but care must be taken on making cuttings from those to take off the cutting close below a point or eye. The reason for this is that all plants of this class loose their tops annually and remain dormant as the tubers have no eyes from which to start a new growth but start only from a crown. It is necessary to leave the callous of the cutting form immediately below an eye which will make a crown for the tuber when it becomes dormant. Cuttings taken with the base between the eyes, in this class of plants will grow bloom as well and make a good plant the year they are struck but when they become dormant they can never grow again, as in that case, they lack the necessary crown.

Clemitis also should be cut just below an eye for the same reason. This rule applies to all deciduous tuberous rooted plants, whether hardy or tender that will propagate from green cuttings.

There are many other methods of propagation practised such as budding grafting, inarching, etc. that could not be clearly presented in this article as most of them would have to be practically illustrated in order to be plainly understood. I have briefly given the easiest and best methods for an amateur and if carefully carried out will give satisfaction.—H. E. G.

Cheap Fares to Toronto Exhibition

In connertion with the Canadian National Exhibition at Toronto which will be held this year from August 24th until September 9th, the Intercolonial Railway will give very low excursion rates which will give the opportunity to many to visit the "Queen City" on the occasion of its great annual fete.

The Toronto Fair is the largest and most attractive of annual exhibitions in America, and this year new permanent buildings have been constructed and its extensive boundaries enlarged by new boulevards. Aside from the attraction of the exhibition a visit to Toronto at this season is sure to be enjoyable and with the very low rates prevailing it will be possible for persons of moderate means. The going dates are: August 22, 24, 25, 27, 28 and September 4 and 5. A special rate from all states will prevail on August 23 and 25, and on September 3rd. All tickets are good to return September 11th, Maritime Province travellers will have their choice of two through vestibuled trains, the Ocean Limited and the Maritime Express, both of which connect at Bonaventure Union Station, Montreal, with the through Grand Trunk Railway trains for Toronto. It will be well for intending travellers to apply early for reservations. Particulars will be given by the local ticket agents.

DE LAVAL
CREAM SEPARATORS

SAVE MUCH TIME AND LABOR
IN SUMMER

Besides their great increase in quantity and improvement in quality of cream and butter DE LAVAL cream separators save a great deal of time and labor.

This great saving of time and labor counts for more in summer than at any other season and often alone saves the cost of a separator, aside from all its other advantages.

As compared with any kind of gravity setting the saving of man's time and labor and usually woman's drudgery is simply overwhelming.

As compared with other separators the DE LAVAL saves much time and labor by its greater capacity, easier running, easier handling, easier cleaning and freedom from need of adjustment or repair.

These are merely some of the advantages which make a DE LAVAL cream separator the best of all summer farm investments, as every DE LAVAL agent will be glad to explain and demonstrate to anyone at all interested.

See the nearest DE LAVAL agent **at once** or if you do not know him write us direct for any desired information.

Early, Deep Ploughing and Thorough Cultivation

Control Crop Growing Conditions.

By W. M. Lea, Victoria, P. E. I.

PROBABLY the most import operation in connection with the preparatory cultivation of the soil for crops is the work of ploughing. If ploughing has been properly done, at the right time, we add greatly to our chance of securing a good catch of seed and a full crop. With the single exception of the corn crop I think all ploughing should be done for our crops the previous autumn, and at the proper time and depth according to the nature of the soil, and sod that may be on it.

An old pasture, or field that has been left under hay or pasture for some time, that may be growing considerable red top and weeds should, with our Island soil, be ploughed deep, that is, deep according to what is commonly called deep ploughing. I don't think any number of inches can be laid down as a rule to follow but in a heavy sod such as I have described it should be turned under deep enough to bring up several inches of loose bottom soil on top for a seed bed. If the field is to be seeded out to clover the ploughing should be done in September and harrowed, at intervals, until the frost comes in order to hasten decomposition of the sod. The frost will then put it in proper condition for the crop. If a second crop of grain or roots is to follow, I would not harrow in the fall as we might liberate more plant food than would be desirable for this rotation.

Most of the fall ploughing is done entirely too shallow, and not early enough, especially since the two furrowed plow came into general use. This rushes the work and it is usually worked with three horses, and being often light ones, it is a temptation for a teamster to lighten the work on a heavily loaded team.

I had this brought to my notice several years ago in a sod field we fall ploughed for oats. We took a single plough without a wheel to open up the ridges and finished the same afternoon with this plow. This plow turned a narrow furrow as we had no wheel to keep it out and the ploughing was pretty deep bringing up enough sub soil to give it a pretty highly colored cast. The balance of the field was ploughed about four inches deep with the two furrow plough. The subsequent cultivation was the same. After the grain headed out next summer we were surprised to notice the great difference in the crop on the deeper ploughing, it being several inches higher and much heavier headed.

We aim to plough everything (excepting the land intended for corn) that is to be put under a cultivated crop, in the fall as it saves time which is so important in the spring, and further we don't consider it is possible with spring ploughing to get as good a seed bed by any sort of after cultivation. The fall of 1910 being fairly open we ploughed everything we intended to crop even to our turnip land. Most of our grain follows root and corn land, and the corn land being spring ploughed sod turning under a heavy coat of grass we plough it deeply and leave it in the rough. When springs opens, up this land will be found to dry and warm up much readier than unploughed land. The spring-tooth-harrow, in my opiniun, is the best implement to get it into proper shape for grain and hay or clover seeds. This harrow does not cut as deep as the disc or cultivator but makes a very fine bed as the soil is scraped off fine. I do not like too deep a seed bed for grain. The soil we loosen up dries out and forms a mulch for the moist under soil. This mulch should not be very deep as the oats should be sowed with a disc drill, if possible, in the moist soil underneath leaving the loose mulch over them. Harrow then as late as possible with a light harrow or weeder just as they are coming through.

This was the preparation we gave our land in the season 1911 and although the weather was exceedingly dry and all grain prematurely ripened we had a very heavy crop. The fall of 1911 being also dry and land baked hard we foolishly put the ploughing off with the result that there was not sufficient time to plough either the corn or root land and both were left until this spring. Now, while I do not favor spring ploughing for grain, circumstances sometimes force us to do so, and under the system we follow to grow the corn crop, we must always plough before grain is sown or is seeded out. With turnip land it is not so necessary and, while we always plough it in the fall if possible, (on account of being able to sow it so much earlier in the following spring,) if the land were clear I would have used the cultivator alone.

In the spring of 1912, as stated above, the corn land had to be ploughed pretty deep to get under the sod, and it came up heavy and cloddy and no amount of disc harrowing or any other kind of cultivating could put it in as fine condition for grain and seeding to clover, as the two cuts of a spring tooth harrow did when the land was ploughed in the fall, and the frost, that great thorough cultivator had done its work through the winter. This season being, for the past three weeks, very moist the grain where sowed in the proper season on fairly fertle soil will yield a heavy crop of straw ; but extremes of any sort or condition of weather should always teach us something. While especially favourable seasons for growth give us paying crops on very many and different kinds of cultivation we should always plan to combat the worst conditions that may arise in all our farming operations, so the first and most important rule is to plough early, thoroughly and deep as the depth of your soil will warrant. I cannot agree with the advocates of shallow ploughing. Have everything ready to get on the land as early as it will work properly in the spring and then harrow everything red as fast as possible to loosen up a little surface to mulch the land below. This will dry and the land will warm faster and it will act the same as if one dusted a layer of dry loose clay on top of a moist surface. It will mulch it. Sow the grain pretty early. You can sow too early but you are not very liable to, and it is a safe side to be on, especially if you are sowing clover with the grain. Sow as good seed as you can secure and treat it with blue stone or formation to destroy the smut. This province is going to loose thousands of dollars this season with smut in the oats. Never in my experience have I seen it so bad. While on a ten mile drive through the country the other day I noticed many fields that have at least one third of the heads destroyed by smut, ann one field particularly that I noticed where treated seed was sowd did not contain any. We tried it this year on part of one field and the difference is amazing between the treated and the untreated seed, and while I consider this province grows entirely too great an acreage of oats for export, if we are going to grow them, we should endeavour to give the cultivation and seeding every care necessary to give us the largest possible crop. With this season of excessive rain we certainly should have land in condition to plough early and where oats are to be grown, and land seeded out or where turnips, potatoes or any other root crop is to follow, my advice is to plough early.

The Common House-fly and Its Dangers.

There are a number of different species of flies that enter houses. Some of these species are so much alike in appearance that most people cannot tell them apart, while others differ so much in size and in many other ways that only a glance is required to distinguish one from another. Two common species which are entirely distinct from one another in size, appearance, and breeding habits are the house-fly and the blow-fly.

The females of the house-fly pass the winter in attics, cellars, dark rooms, and various more or less protected places about buildings and perhaps in other locations. It is not rare to observe them buzzing about in warm rooms at almost any time, even in cold weather. The winter season for house-flies for their numbers are much reduced. Only a small percentage of the feamles survive even the first cold weather, and many of those that are left meet death in one way or another. When spring comes only a comparatively small number remain to furnish the source for several generations of flies the following summer. This fact explains why house-flies are rather scarce for a time in the spring.

It is always noticeable that as fall approaches flies become more and more numerous. This condition is easy to understand when the very short life history and their reproductive powers are understood. The females that have passed the winter are ready to lay their eggs as soon in the spring as conditions are suitable. The average number of eggs laid by a single female is stated to be about 120. In warm summer weather eggs hatch in eight hours and the larvae grow to full size in five days. Five more days are required before the adult issues from the pupa. Therefore, under the most favorable conditions of temperature, only ten days are required to carry the insect from the egg to the adult. We now have sufficient evidence to account for from twelve to fourteen generations of the house-fly during a season that is favorable to reproduction.

The house-fly has long been known as a distinct pest about the house, but not until within the last few years has it become known as a prominent enemy of mankind on account of its being associated with the carrying of various infectious diseases, chief among which, in this country, is typhoid fever. Many physicians, as well as careful students of insects, have contributed to the study of this matter and all have arrived at the same conclusion, namely that flies undoubtedly serve as carriers of the germs of typhoid.

Dr. Victor M. Vaughan was a member of the typhoid commission appointed to make an investigation of typhoid fever in the concentration camps of the United States Army in the summer of 1898; he is authority

How can one tell what filth the clean appearing house-flly last visited? Perhaps where there are typhoid germs.

The birth place of house-flies.

They may fall into milk after having typhoid germs or other bacteria on their feet.

One way of carrying bacteria of tuberculosis to foods.

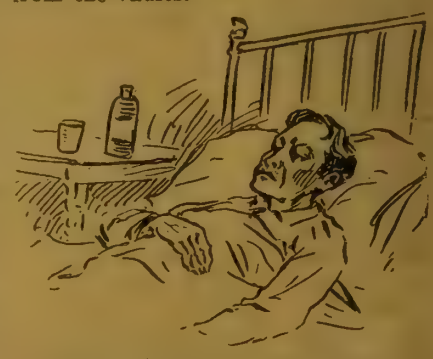
in regard to the ways by which flies aid in the transmission of typhoid: "It is possible for the fly to carry the typhoid bacillus in two ways. In the first place, human excrement containing the typhoid germ may adhere to the fly and be transported. In the second place, it is possible that the typhoid bacillus may be carried in the digestive organs of the fly and may be deposited with its excrement."

House-flies have been observed to lay their eggs on many substanees, among which are horse and cow manure, human excrement, collections of fermenting vegetable refuse, bedding of poultry pens, miscellaneous garbage and the like. The known habits of the flies show that they go from these unclean substances, laden with various germs, to kitchens where they run over the food, dropping the germs promiscuously; then back they ao to the place where the eggs are laid, gather an additional supply of germs, and return again to the kitchens. What a preventative is the door or window screen! Dr. Vaughn made the following statement: "Flies swarmed over human excrement in the pits infected with typhoid germs and then visited and fed upon the food prepared for the soldiers at the mess tents. In some instances, where lime had been recently sprinkled over the contents of the pits, flies with their feet whitened with lime were seen walking over the food."

After gathering the facts concerning the movement of flies and their ability to carry germs from the substances in which they breed to food products, where they may be taken into the digestive system of man, Dr. Howard was led to make the following statement in one of his publications: "Now when we consider the prevalence of typhoid fever and that virulent typhoid bacilli may occur in the excrement of an individual for some time before the disease is recognized in him and that the same virulent germs may be found in excrement for a long time after the apparent recovery of a patient, the wonder is not that typhoid is so prevalent but that it does not prevail to a much greater extent."

Two investigators, Esten and Mason, at the Storrs Agricultural Experiment Station, Storrs, Connecticut, have issued a bulletin entitled "Sources of Bacteria in Milk" in which a table is introduced showing a number of bacteria of all kinds that may exist on a single fly. Flies were caught under different conditions with a "germ free" net, each was placed in a "germ free" bottle and a known quantity of "germ free" water added. Then by shaking the bottle a condition similar to that of a fly that had fallen into a can of milk was produced. Individual flies to the number of 414 were treated in this way and the results counted, showing a minimum of 550, a maximum of 6,600,000 and an average of nearly one and one-fourth million bacteria. Of course not all of these bacteria were injurious, but in case flies are carrying typhoid germs it is easy to understand how these may get into milk.

From the evidence at hand, we are convinced that the fly is a very important agent in the trans fer of bacteria from one place to another and from this standpoint is a menace to public health. Circumstances call for the co-operation of the inhabitants of both country and cty in a general warfare against it. Since horse manure in the proper condition with respect to moisture is known to be the natural breeding place of the insect, certain practices directed toward keeping flies away from this material should be adopted. Several cities have adopted the plan of compelling owners of horses to build tight bins for the reception of stable refuse and requiring the sweeping of stables regularly; noticeable results have been accomplished. On farms in summer this method does not appear to be altogether impractical. It is know that flies do not select dry manure on which to place their eggs; so if the barn and yard are cleaned up systematically once or twice a week and the resultant spread in the fields much will be accomplished in preventing house-flies from multiplying and the manure will be handled in such a way as to give the most satisfactory results as a fertilizer. Approved methods of handling garbage and modera methods of sewage disposal should be adopted. Since the most likely place for flies to pick up typhoid bacilli is about human excrement this substance should not be left in exposed places, and closets should be constructed so as to exclude the flies from the vaults.



A typhoid patient who contracted the disease from eating food to which the germs had been carried by house-flies.

The August Fruit Crop Report.

APPLES.

No marked change has taken place in the prospects for the apple crop. The weather upon the whole has been favorable, except in so far as the damp weather has induced fungus. Nearly all correspondents report the growth as excellent, larger indeed than usual. There does not appear to be any exceptional complaint with reference to insects. The general average of the Dominion stands at 69 per cent for Early Apples, 65 per cent for Fall Apples and 61 per cent for Winter Apples. The average of the Dominion would be 65.

A number of correspondents report that their orchards which have received good attention for a number of years, are giving annual crops instead of the usual biennial crop. That the weather is not the sole cause of alternate years of bearing receives confirmation by one correspondent having a large orchard, practically uniform without, but one-half which bears heavily one year and the other half the next, with scarcely any year a failure.

District 1, North of Lake Erie, Ont. —Early apples are turning out a good crop, but winter varieties have fallen below the average. The orchards in Kent and Elgin are above the average of the district. Shipments are now being made for the early varieties, Yellow Transparent, Red Asracchen and a few very immature Duchess. The quality is only medium. Although the size is fair, the apples lack colour and maturity, and scab is noticeable. The season is yet a week later than usual. The first apples from Ontario landed in Winnipeg August 12, in good order but of low grade.

District 2. Counties on Lake Huron and inland to York County, Ont.— Winter varieties show no improvement, the Spy and King being partcularly scarce. Russets, Baldwins

and Ben Davis show slightly less than a medium crop. The Wagener, though not much grown, promises a fair crop.

District 3. Lake Ontario Counties and North of Georgia Bay, Ont.—Winter apples show for 36 per cent of a full crop. The Spy and King are short. Baldwins, Russets and Ben Davis will furnish the largest portion of the crop. Greenings will be about half a crop. Early and fall varieties ies will be a medium crop.

District 4. Ottawa and St. Lawrence Valley and Southwestern Quebec.—The average standing of the McIntosh Red for this month is 60 per cent of a full crop. This average, however, scarcely gives a fair estimate of the quantity of Red McIntosh that will be offered for sale. In the wetsern part of this district, where the McIntosh constitutes the main variety in the orchards, the prospects are for less than half a crop; in many cases a total failure is reported. In the Eastern Townships and other parts of Quebec, where there are comparatively few, the yield per tree will be much better.

The trees in this district show the effects of defoliation by the Tent Caterpillar, and correspondents report all apples as likely to be smaller than usual. The excellent growing weather of the last two or three weeks, if continued, may do much to improve the size of the apples. Scab will undoubtedly be much in evidence.

District 5. New Brunswick and North Eastern Quebec.—The Duchess and the New Brunswicker in the St. John Valley are only a medium crop, but the quantity of sprayed fruit is increasing.

District 6. Counties of Hants, Kings, Annapolis and Digby in Nova Scotig.—The prospects as reported by our correspondents show some improvement. The winter apples stand at 64 per cent of a full crop. Baldwins and Kings lead with Ben Davis following. Golden Russet, Spy, Fallawater, Greening and Blenheim are all much less than half a crop. Gravensteins maintain the promise of a medium crop. All orchards not exceptionally well sprayed will show some scab. A number of correspondents predict an extra large quantity of No. 3 fruit.

District 7. Nova Scotia Counties not included in district 6.—The orchards are showing for a fair crop, but the aggregate of fruit will not be sufficient to meet local demands.

District 8. Prince Edward Island.—The crop generally will be light, but early varieties show better than late varieties. There has been more spraying done on the Island this year than usual, but the amount of defective fruit will be large.

District 9. Lower Mainland and Island of British Columbia.—The crop will be only fair in quantity. Certain orchards will have very fine apples, and the colour and size will, perhaps, be better than usual. There will not, however, be enough apples to supply the local demands. Aphis is responsible for considerable injury and scab is developing.

District 10. Inland Valleys of British Columbia.—An especially fine crop is promised in this district. The apples have coloured well and, though the season was late in starting, the excellent growing weather has pushed the crop so that the early apples are now on the market, and of fair quality. The Okanagan district will export large quantities of fall and winter apples. The Boundary District will also have a total shipment of about 40,000 boxes. The Kootenay district, including Nelson, will have the grade of the apples lowered very materially through the effect of the hail storm of July 21.

PEARS.

In the inland valleys of British Columbia, pears are likely to be a good crop. The only disease much in evidence is blight. The size and colour appear to be good. The crop on Vancouver Island and on the coast is not quite so good. The varieties showing up best in British Columbia are the Clapp, Bartlett and Anjou, though the Clargeau and Flemish Beauty are well loaded.

In Eastern Canada pears are, on the whole, rather light. The large commercial orchards of District 1 have only about half a full crop. The Bartlett, Bosc and Winter Nelis make the best showing. The Kiefers appear to be rather a short crop. In District 3 the pear crop is very light, almost a failure. The pear crop in Annapolis Valley is a good average one and fairly clean. Correspondents report considerably higher percentages for this month.

PLUMS.

The percentages for the Dominion are higher this month than last.

The crop on Vancouver Island and the lower mainland in British Columbia will not be large nor the quality of the best. The rest of the Province has an excellent crop of nearly all varieties. The Italian prune shows particularly well.

In Eastern Canada the crop is below the average except in Nova Scotia, where practically a full crop is reported. It is quite possible that shipments of Nova Scotian plums may reach the markets of Montreal and Ottawa this year to supply the deficiencies in Districts 1 and 2, which usually have a lrage quantity of plums for shipping. The Japenese plums have proved too tender for many parts of Quebec and Eastern Ontario, but in these districts several native varieties of excellent quality are now grown in marketable quantities and plum growing is not unlikely to take anew lease of life where the European and Japanese varietiez have failed.

PEACHES.

The number of peach trees n British Columbia is not large and the industry has had a severe set-back in the matter of winter killing. Wherever the trees withstood the winter, they are well loaded, a full crop being reported in nearly all varieties.

The crop in western Canada is only medium or somewhat less, especially in the late varieties. District 1 is the only section having a crop that will more than meet the needs of the local market. The completion of the canners will materially affect the amount of fruit placed on the general market. The shortage of canned goods makes it probable that the canneries will use a much larger portion of the crop than usual.

SMALL FRUITS AND CHERRIES.

The small fruit of Canada, as a whole, is in a transition state. At only a few points has the industry developed into anything beyond supplying local markets, and at present the effect of this condition is very noticeable. In all the provinces many of the localities that, up to this time supplied the local markets, are now reporting a possible decline in the industry. The reasons most frequently given for the decline are the difficulty in getting pickers, the inadequate transportation facilities and, in one ot two cases, low prices. On the other hand, in such places as St. Catherines, Ontario, where they have for several years shipped to the Northwest and to other distant points, and where competing canneries have been established, and increase is reported. The extraordinary high prices that have prevailed this year do not seem to be a sufficient incentive to induce larger plantations. The industry has evidently reached a point where organization and efficient leadership would do much to develop it.

The acerage for fruiting next year has not been increased. The stand secured has been good and with average weather conditions this fall and next winter, a crop slightly better than that of 1912 will be produced in 1913.

The prices for strawberries in Eastern Canada varied from 8 to 14 cents per box to the grower. One of the best growers in Nova Scotia contracted for the whole of his crop at 9 cents per box. The price in Prince Edwars Island and New Brunswick varied almost in proportion to the transportation facilities. The Ontario prices in a few cases went as low as 8c. per box to the grower, but usually as high as 10c. and 12c. was received. Prices in British Columbia were the lowest there that growers have ever received. The acreage there is now sufficient to supply the local demand, but the quality of the fruit this season and the facilities for transportation were not such as to permit of long distance shipments. Prices went from $2 to $2.50 per crate of 24 boxes.

Black currants are always in demand, and the market for them never appears to be glutted. The same, however, cannot be said of red currants. The acreage of red currants has been rapidly increased of late years, and this year all demands were supplied at a price in many cases lower than most growers considered remunerative.

For the first time, too, in several years the crop of sour cherries appears to have reached the limits of the demand, and considering the heavy plantations that have been made for the last three years, it would seem that some new outlet must be sought for these fruits if over-production is to be avoided. sweet cherries were not in sufficient quantities to meet the demand, though the crop as a whole was fair.

British Columbia sweet cherries impressed the market most favorably and, no doubt, any obstacle in the way of the industry will be overcome as to make provision for a very large output of this favorite fruit. It is unfortunate that this year the wet weather rendered all the later cherries much too soft to ship. The canning factory at Vernon served the interests of the neighborhood well, and it is said to have taken something over 75 tons of cherries from the growers.

TOMATOES.

Tomatoes are growing rapidly and the prospects are for a large crop, though the acreage is not nearly sufficient to supply the demands. The canners are bidding very high for the crop, so that the shipping stock will not be more plentiful than usual.

CRANBERRIES AND BLUEBERRIES.

Cranberries in Quebec, New Brunswick and Nova Scotia are looking excellent, and there is every prospect, at the present time, of a full crop.

Blueberries are only a medium crop in Quebec, but are much better further east, and Nova Scotia reports 101 per cent of a full crop.

INSECTS.

The Coddling Moth does not appear to be particularly troublesome this year. Nevertheless, there is enough of it to make it still the most serious insect enemy of the apple. Aphis has always been a serious pest in British Columbia, and is quite prevalent this year. In Ontario, District 3 reports an infestation of Aphis, and Nova Scotia is also affected. So far little spraying has been done for the Aphis.

Nursery stock is responsible for a large number of insects, and the new orchards now being planted over the fruit sections of Ontario and Nova Scotia appear to have introduced the Bud Moth and Blister Mite. Until recently we had few complaints of either of these insects. Bud Moth was reported earlier in the season from practically all the principal apple districts. The Blister Mite is now reported from all the districts in Nova Scotia and Ontario, where numerous plantations are being made.

A fair degree of success appears to have attended the efforts to exterminate the San Jose Scale in Nova Scotia. The Rose Bug, although confined to a very limited area, appears to be proof against all remedies. The grape industry in Welland County, Ontario, is suffering severely from this pest.

MARKETS.

The condition of the markets, so far as Canadian apples are concerned, are fairly reassuring. The apple crop in Europe is universally short, and this shortage, though it may be in countries such as Austria Hungary, Switzerland and Italy, to which Canadian apples are not expected, has a direct influence upon the export price of Canadian apples. Germany imports an average of 3,000,000 barrels of apples from the surrounding continental countries annually. The imports from Canada and the United States so far have not been large, but there seems no reason why there should not be a splendid opening this year in Germany and probably in other countries on the continent. The prospect for improved transportation from Canada direct so Germany is good. If the proper commercial connections can be made at once, there would seem to be a possibility of making up by exports from Canada the shortage that Germany will have in her imports from Continental Europe. France may be expected to take fairly large quantities of late winter varieties. Russets and Ben Davis have been favorites for this trade in the past.

The British markets offer more than ordinary attractions this year. There is undoubtedly a general shortage of fruit. The industrial conditions, while not without disturbing elements are not such as to discourage generous buying on the part of the English wholesale merchants.

Some uncertainty surrounds the conditions of the American apple crop. It is undoubtedly only an average crop in any particular locality, but this average crop is so widely distributed that many large markets will be supplied locally with the great bulk of fruit required. The class of fruit that most concerns the Canadian grower is the supply of winter apples or the quantity that will go into cold storage that may come into consumption during the months of December, January, February, and March. This grade of fruit is not abnormally large in the United States this year and if good industrial conditions continue to exist, the greater part of this will be absorbed by the home market at fair prices. Nevertheless, should there be a special demand from European markets, a large portion of this fruit would be immediately available to meet it.

The prospects, therefore, would seem to be for a fair to medium demand in Great Britain for fall and early winter fruit, and perhaps a somewhat better market for winter fruit. Should Canadian apples, suitable for late winter shipments, pass into strang hands prices may rule fairly high in Great Britain.

One of the disturbing elements in the Canadian apple market is the large crop of the American Pacific States. These apples compete at a disadvantage in the English market, but are practically on even terms in the Northwest markets. It is quite possible, therefore, that the Northwest will receive this year a very large quantity of imported apples. It is possible, too, that the British Columbia shippers, having their first large crop for export, may not be so well organized as to meet with advantage the competition of the American growers.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

LEADERS IN PRIVATE LIFE.

As great as are the opportunities for honest, capable young men in public life, these opportunities are not better than honety, capability and efficiency in private life. The public man is largely a servant for others; his home life is not free and independent like that of the private citizen. The sacrifice of holding public office is greater than most men can afford to make. All honor is due the honest, conscientious, efficient officer; he deserves a greater reward than is available in the emoluments of public office.

But a more fortunate man is the capable, efficient leader in private life. He reaps as he has sown, and sows as he expects to reap. His fellow citizens are made better by his every-day life as he goes in and out before them. The sun never set on his influences, for it lives from day to day and from year to year, gaining momentum as the years pass.

Our heroes are not only men who have held public office, nor those who have defended the country's honor in battle; there are thousands in private life who are leading others to higher and nobler lives, pointing the way to loftier ideals. Every young man may be one of these leaders; it should be his greatest aim in life so to be.

Whealth and fame are legitimate and desirable, if honorably acquired; but no one can afford to sacrifice the higher and holier things of life to acquire them. The greatest asset to a young man in either public or private life is moral character, which qualifies him as a useful citizen and a leader among men for high ideals and lofty achievements.

FAIRS AS EDUCATORS.

Every year the provincial fairs in the various provinces of Canada are emphasizing more persistently and more effectively the educational features for which they were originally founded the line of demarcation between the purely entertaining and the genuinely educational features of the fair is becoming more sharply drawn and more clearly defined. Not only are the instructive exhibits placed where visitors may see them, but attention is drawn to them and the lessons they teach us are more clearly shown than ever before. Demonstration and lecture halls at the fairs are always inadequate to accommodate the crowds who are anxious to see and hear. Machinery in active operation is always surrounded by interested spectators, and the sales of specialized machinery on the fair grounds are astonishingly large. The old-time fair meant to the average mind horse racing and side shows, with a few exhibits of grain, vegetables and live stock, to be viewed in a perfunctory manner should time permit. The big provincial fair of to-day very properly provides amusements and entertainment of the highest possible character for its patrons, but it has also taken its legitimate place as the central clearing house for agricultural information. The boys' schools maintained by several of the largest fairs, show that these institutions are thoroughly awake to their opportunities as educational factors and have grasped that essential principle in all education that impressions upon the minds of boys and girls are more permanent and more lasting in their effects than those gained in after life. These state fair schools are rich in promise for the agriculcural and rural life of the next generation.

THE NEW BRUNSWICK FARM SETTLEMENT BOARD.

The New Brunswick Government has taken another step by the appointment of a Farm Settlement Board whereby New Brunswick initites a new policy for the reoccupancy of vacant farm lands by a prosperous husbandry.

The Government recognized that some material assistance must be rendered by the powers-that be-to keep the sons and daughters of our farmers in the homeland. The ready-made farm, with easy terms for its purchase, will be an allurement that will undoubtedly appeal to those who are looking to better their condition. Instead of the wander lust taking them to the West and across the Border, they will be enabled to secure a start in life close at their doors under conditions which will compare favorably with any to be found on the Continent.

The members of the board are Thos. W. Butler, Milltown, Charlotte County; Wilmot Hay, Woodstock and Jas. Gilchrist, Provincial Superintendent of Immigration.

The first meeting of the board was held in the government rooms, Church street, St. John, on August 25th. Most of the time was occupied with discussing the methods of carrying on the work for which the board was appointed. In addition to the members of the board there were present Premier Flemming, A. B. Wilmot, Dominion Immigration Agent for New Brunswick and Percy Thompson, of the Norton Griffiths Company. Thos. Butler was elected chairman of the board; Mr. Gilchrist is secretary by virtue of the act creating the board.

The board decided to pay a visit to a number of sections of the province where land is available for farm settlement purposes, and to meet again in St. John on September 3rd.

Mr. Thompson on behalf of Norton Griffiths spoke of the intentions of his company in regard to bringing out settlers from England, and made a proposition in regard to taking up some of the ready-made farms which will be established in the near future. He stated that next spring it was hoped to send quite a number of Englishmen to this country.

Mr. Wilmot, the Dominion Immigration Agent, will visit the various parts of the province with Mr. Thompson for the purpose of securing information in regard to lands which may be made available for settlers which will be brought out by the Norton Griffiths Company.

SYSTEMATIC SEED IMPROVEMENT

In the production of the ordinary farm crops of Canada, approximately 40,000,000 bushels of seed are required annually. In view of the enormous extent to which yield is dependent upon the quality and vitality of the seed sown, it is of the greatest importance both to the individual farmer and to the nation that as much of this seed as possible be of a high order.

The wide spread efforts which are being put forth in Canada by the Canadian Seed Growers' Association to encourage a larger production and more general use of pure and vital seed of productive sorts, is the subject of a recent address by Mr. L. H. Newman, Secretary of the above Association, delivered before the Standing Committee on Agriculture and Colonization of the House of Commons.

In this address the speaker traced the origin and development of the Association and dealt briefly with the real nature and extent of the results which are being realized. An instructing exposition is also given of the modern conception of the principles of plant improvement and of the efforts which are being made to take advantage of these principles in the amelioration of our plant races. Finally there is presented the system of Seed Registration and the recently instituted plan of inspecting and selling all sacks of seed before they leave the premises of those growers who grow seed for the trade. This address which is printed in pamphlet is being distributed free by the Publications Branch of the Department of Agriculture at Ottawa.

BE ON THE LOOKOUT FOR NEXT YEAR'S SEED.

Owing to prolonged season of damp weather during the first part of August the grain crops are a little late in ripening. With the splendid growing weather we are now having the various crops are now turning very fast and the harvesting season is here. Now is the opportune time for the careful farmer to go over his fields and pick out a patch of grain which will serve him for seed next year.

A farmer generally has an idea on what portion of his holding his grain grows best, and the section with the most vigorous plants should be selected. This section should be carefully watched and all weeds and other varieties of grain picked out by hand. No machinery can clean seed so well as the two hands, and with a little care and perseverance a farmer may have a plot of grain set aside for seed almost absolutely pure. Then when threshing time comes see that the grain is threshed by itself and put away in a bin by itself, and the big portion of the worry about next year's seed is over.

EDITORIAL NOTES.

Bad luck in farming is usually preceded by bad management. Luck, whether of the bad or the good variety, is a result of our own management.

Young people should feel responsibility if society in the neighborhood is not as elevating as it should be. It is remarkable how changes in moral and social conditions may be wrought by intelligent leaders. If the ideals of the community are too slow, help direct the thoughts and sentiments of the more intelligent to higher and better things. The others will then adjust themselves to the better part.

We should have a tender feeling for the farm that produces our food and makes it possible for us to enjoy life. To rob the farm of its fertility and return nothing is a barbarous custom that should have no place in present day methods of farm management.

Provincial Fair Benefits.

What is going to be the greatest good that you will derive from your visit to the fairs during the next few weeks? This is a subject that you can decide for yourself. It is taken for granted that you will attend and the question is, what department will be most interesting and attractive?

Some will go for amusement and recreation. But even these will be benefited for they cannot fail to appreciate more the vast importance of the Canadian farm after having seen the exhibits that will be displayed at every fair ground in the country this fall. Some will go as exhibitors. To such a fair is scarcely a continuous round of pleasures because the exhibitor has a rather strenuous time of it. But he is in a position to acquire more valuable information than perhaps any other man on the ground.

His stock is being put up in competition with that shown by others and whether he is successful in winning the most coveted prizes or whether he is defeated, he will not have derived the greatest benefit if he goes away without a better knowlege of handling, fitting and showing stock. It is information of this kind that does much to improve the standard of stock on the Canadian farm.

Some will come to learn what they can about some specific line of farm work. It may be that they are interested in buying better breeding stock and it may be that they are seeking information along an entirely different line, but whatever their mission, if they are in a receptive mood while they attend the fair they will return home benefited by their visit.

Sheep in the Maritime Provinces.

There is room for a big boom in sheep raising in the Maritime Provinces and a large part of the country is ready for it. Sheep raising has always been profitable—even when low prices prevailed. With the present exceptionally low prices for lamb and mutton, even if the quotations on wool are lower, the business is more profitable than ever. Of course there are drawbacks—there are to everything in this world.

There is the fencing and there is the dog nuisance. But fencing is not nearly so costly as the extra value of the buildings required for cattle and horses, in comparison with those required for sheep, etc., and the dog nuisance, while very real, is not as great a menace as it is sometimes made to appear, for the facts are that, despite this drawback, there are hundreds of farmers in the Maritime Provinces who are deriving a tidy income from their sheep.

One hears so much talk about the dog nuisance that if not informed, he would think there was no legislation dealing with this question in the Maritime Provinces and yet, in Nova Scotia and we believe in the other provinces, any sheep owner is permitted by law to shoot a dog that is even frightening his sheep. Prince Edward Island has gone a step further and has put a tax on dogs. Nova Scotia and New Brunswick might well follow the example of their smaller sister province and it only requires a few leading spirits, alive to the value of the sheep business, to bring about Legislation that will bring that about.

Nothing is making people of the East think about sheep so much as the present labor conditions, for sheep, of all classes of farm stock make the least demand upon that costly and difficult to obtain— commodity labor. There is danger, however, in this view of economy of labor in sheep raising and the whole question, with which subsequent paragraphs of this article deal, depends upon this. The danger lies in forgetting that, while sheep only require a small quantity of labor they demand a high quality of labor. It is the little attentions to change of pasture, giving salt, keeping the feed troughs clean, providing exercise in winter time, attention to lambing, the weeding out of diseased sheep and those that have lost their teeth, etc., that make the difference between a $28 to $40 profit on sheep and a corresponding loss. In the following paragraphs, we present a few instances of profitable sheep raising in Nova Scotia. We must frankly admit, however, that we could give a number, lesser it is true, but none the less a real number, of those, who, because of failure to pay these little attentions to sheep, have had a balance on the wrong side of the ledger. But for profits.

A few years ago, we secured from a prominent breeder of Nova Scotia an average statement of the returns of a flock of fifty ewes and one pure bred ram. At that time he valued his ewes at $5.00 each and he sold his lambs at $3.00 each. To bring the figures up to date, we are valuing the ewes at $7.00 each and the lambs at $4.00 The following is a statement:

Value of fifty ewes at $7.00 and one pure bred ram at $25.00—$375.00.

Income—	
70 lambs at $4.00	$280.00
300 lbs. washed wool at 27c	81.00
	$361.00
Expenses—	
500 bus. turnips at 6c	$30.00
50 bus. oats at 50c.	25.00
1 ton wheat bran at $24.00	24.00
12 tons clover hay at $7.00	84.00
	$163.00
Net Profit	$198.00

In this statement no allowance is made for labor or pasture, the owner considering that the value of sheep as weed destroyers, together with the manure produced, would offset that item. Granting, however, a liberal allowance of $50 for summer pasture there is still left a profit of $148.00, or a little over 36 per cent. on his investment. To make this statement complete, a further allowance should be made for interest on the value, as well as for the depreciation of buildings used. But as a very cheap class of buildings suffice for sheep, it must be evident to the casual observer that this man could easily figure on a 25 per cent. or higher profit on his sheep every year.

We submitted these figures to a number of sheep men in the province and asked them to make these a basis for comment. In reply, a prominent sheep raiser in Antigonish County wrote as follows: "Most sheep farmers in this county can cut one third off the figures of the expense bill in wintering their flocks. I do not say that but the extra feeding would pay, and is probably practiced by men who raise sheep for stock purposes, and sell accordingly, but the common farmers of this country will substantiate my statement. As an instance of the profit of sheep rearing of this country, I submit the following statement: Early in the spring, I bought at auction, 9 ewes, ranging in age from one to four years.

Income—	
June. 50 lbs. washed wool at 30	$15.00
Oct. 13 lambs at 5c per lb. live weight	52.00
	$67.00
Expenses—	
May. 9 ewes at $5.50 per head	$58.50
Feeding same at 50c per head	4.50
	$63.00
Balance	$4.00

In five months' time this small flock of ewes paid for their cost and for their feed and at the end of that time the owner had a cash balance of $4.00, plus the original flock of ewes. There are not many lines of business that will pay off the capital invested in one year and leave a little to the good besides.

Another sheep breeder in Colchester County wrote me that his cost of wintering sheep was very much below that given in the statement submitted to him. He says: "The following is my own statement of cost of wintering 16 ewes:

Expenses—	
One ton hay	$10.00
8 bushels oats	4.00
	$14.00
Income—	
20 lambs at $2.75 and $3.00	$57.50
Kept 8 best ewe lambs at least	24.00
80 lbs. wool at 29c	23.20
	$104.70

These sheep had the run of a rough, swampy pasture near the edge of a grove of woods. The swamp had not been cut during the year, and therefore, provided food for sheep throughout nearly the whole winter months. One would, however, have to value this pasture at a very high figure before he would reduce this sheep breeders' profit below 50 per cent.

We have heard of many more instances of equally large profits on sheep raising in the Maritime Provinces, but we cannot at the time of writing put our hands upon the exact statements. We would suggest, Mr. Editor, that you ask interested correspondents in the Maritime Provinces to submit other instances of profits made in sheep raising. By so doing, you would give a positive contribution to the sheep raising industry in the east, and thereby add to the interest in farm life in these Provinces.—By Prof. M. Cumming, Agricultural College, Truro.

The Use of Paint on the Farm.

There is probably no one point more neglected by the average farmer than the judicious use of paint, not only on his house and outbuildings, but also on machinery and various agricultural implements. It is perhaps the rule rather than the exception in some sections to see houses and agricultural implements on the farm sadly in need of paint. The idea seems to be prevalent that paint is used solely for ornamental purposes, and its use is regarded as a luxury rather than a necessity. While paint does, of course, serve the purpose of improving the appearance of property, it is far more useful for protection than for ornament. A small amount of money and work expended in keeping a valuable piece of machinery properly painted will add greatly to the length of its life. The same may be said of buildings. Another useful object which is accomplished by painting is the improved sanitary conditions of buildings and outhouses. Any man can do an average job of painting, and can thereby not only improve the appearance of his place, but can add greatly to the durability of all articles painted. The cost of such work is small, the necessary equipment is not expensive, and with proper care will last a long time.

Do not use any paints containing compounds of lead about stables or outbuildings where the fumes from decaying organic matter occur, since these gases are likely to darken the lead paints. Do not use with lead compounds any pigments which may liberate compounds of sulphur. For example, ultramarine blue, which contains sulphur in a form in which it may be set free, is a beautiful and very permanent blue and may be used with zinc white, but should not be used with white lead or any other lead pigments. Prussian blue, on the contrary, does not contain sulphur and may be used with lead pigments.

Remember that turpentine and benzine are very inflammable and as not to bring paints containing these special precautions should be taken substances near any light or open fire.

Many pigments are poisonous, and the workman should be particularly careful to remove all paint stains from the skin and not under any circumstances allow any of it to get into his mouth. A man should not eat in the same clothes in which he has been painting and before eating should not only change his clothes but wash all paint stains from his skin. It is not advisable to use turpentine or benzine in removing paint stains from the hands, but by oiling thoroughly with linseed oil, or, in fact, with any fatty oil, and then thoroughly washing with soap, the paint may be removed, provided it has not been allowed to dry too thoroughly on the hands.—Percy H. Walker, in U. S. Farmers' Bulletin.

The New Veterinary Director General.

Owing to the resignation of Dr. J. G. Rutherford, the important position of Veterinary Director-General was temporarily vacant. This position requires a man of particular skill and executive ability owing to the responsibilities attached to it. The man selected to fill this post is Dr. Fred Torrance, of Winnipeg. Dr. Torrance is a B. A. of McGill, and after graduating he spent one year at the Ontario Agricultural College, but his interest in live stock took him to the Montreal Veterinary College where he obtained his V. S. Later the Faculty of McGill conferred on him the degree of D. V. S.

Dr. Torrance started to practice in Brandon, Man., and for some time held the position of district veterinarian under the Provincial Government. Later on he moved to Winnipeg where he established a large practice and was appointed lecturer and later professor of veterinary science at Manitoba Agricultural College when this institution was established. Dr. Torrance is a member of the International Commission of Bovine Tuberculosis, and also the American Veterinary Medical Association, being one of the first vice-presidents of this latter institution. For ten years he has been secretary-treasurer and registrar of the Veterinary Association of Manitoba.

As well as the position of Veterinary Director-General, he will act as live stock commissioner, which latter position has been for the past few months very efficiently filled by Prof. H. S. Arkell, and later these duties will be divided by the Minister of Agriculture so as to give the respective attention they need.

Messrs. McLean and Nicholson received a communication from the Deputy Minister of Trade and Commerce at Ottawa, stating that in answer to their communication he has arranged to have apples and other freight carried on the Manchester Boats from Charlottetown at the same rates as from Montreal. Last year apples from Charlottetown paid nine cents per barrel more. They also received assurance that all shipments from Charlottetown will be handled as carefully as possible. This should stimulate further shipments to the Old Country from the Island Province.

HORTICULTURE.

A Crop of Clean Fruit by Proper Spraying.

In looking over the apple crop prospects of the Annapolis Valley, one cannot but observe the care the apple orchards have had during the present season. Hardly any orchards are to be found but have been given pruning, fertilization and cultivation.

Regarding spraying, the most essential end of all, sad neglect is in evidence, which can be attributed to the comparatively clean apple crop of 1911, even where spraying was neglected. Besides, several good orchardists this year have failed to get results by not applying the spray at the proper time, or in sufficient quantity.

The part of Prof. Wallace's address at Windsor in 1910 where he said, "It has cost the State of New York hundreds and hundreds of thousands of dollars by not spraying at the right time," can be taken home to a good many staunch growers in Nova Scotia this year. The lack of proper spraying this season will cost the fruit crop of Nova Scotia a good many nundred thousands of dollars. Fortunately, there are a few growers who have been wide awake and have got clean fruit. These orchards should be an example to convert the "doubting Thomas."

If there are any who discredit the truth of this statement, let them visit the orchard of Mr. Isaac Chipman, of Chipman Corner. This orchard, under other management, in 1910 hardly produced a barrel of decent apples. Last year it was sold to another party and thoroughly sprayed, giving a fair crop of apples and this year it has not only one of the largest crops of apples to be found in Kings County, but about as clean as it is possible to get during a spotted year like the present one. One large fruit grower examined it last week and said he had seen over 1000 barrels, and not one spot on an apple.

When one comes to reckon up and find that it cost Mr. Chipman less than 15c per barrel to get such results, the loss to the grower who sends the bulk of his Gravensteins and other varieties prone to spot to the evaporator or cider mill through lack of spraying or not applying at the right time, will be very apparent.

If apples bring a normal price this fall, Mr. Chipman will get in the neighborhood of $2,000 clear of expenses, which will be between 40 and 50 p. c. on his investment, which can be charged up to the profit side of careful spraying.

Mr. Chipman has sprayed five times with Lime-Sulphur and Arsenate of Lead, using a power sprayer at 200 lbs. pressure.

An Orchard Meeting will be held there on 19th August. Every one interested in growing better fruit should attend.—C. O. Allen, Kentville.

A Productive Apple Crop.

The life of an apple tree is generally supposed to be much less than 100 years. Yet there are instances here in our own valley which show that with proper care our orchards will continue to produce after the century mark has been reached.

The Acadians when they resided at Canard and Grand Pre planted orchards and grew fruit. They were deported from Horton in 1755 or one hundred and fifty-seven years ago. Yet some of the apple trees they planted are still standing and still producing fruit. Had those trees received careful attention all through the century and a half they might still be regular producers of frut of good quality.

But the purpose of this article is to call attention to a tree which undoubtedly beats the record in the Annapolis Valley. It is a famous Gravenstein tree on the farm of Mr. Jos. A. Kinsman, Lakeville, Kings Co., which is said to be 113 years old and is still heavy producer and a healthy tree. The history of this tree has been preserved and published in some of our immigration literature.

The trunk of the tree is nearly three feet in diameter, the limbs begin to branch out about six feet from the ground, and the branches have a spread of over eighty feet. The tree was grafted to a gravenstein about forty-three years ago. It bears only on alternate years, as a rule, but in some "off" years, it has four or five

For a considerable period Mr. Kinsman kept a record of it's yield, but this has not been continued in recent years. However, it is now producing almost as large crops as it did in the years given below when records were kept.

In 1878 it produced 15 barrels of saleable fruit; in 1880, 18 barrels; in 1882, 21 barrels; in 1884, 20 barrels; in 1886, 21 barrels; in 1888, 23 barrels; in 1890, 20 barrels; in 1892, 21 barrels; in 1894, 26 barrels; in 1896, 27 barrels; in 1898, 22 barrels, making a total of 234 barrels which, at $2 a barrel, were worth $468.

Mr Kinsman kept no account of the apples that dropped during those seasons, nor did he of the loss in picking, which is very great, owing to the top being nearly fifty feet high on one side, in consequence of its position on the side of the bank. In 1896, he should have had over 30 barrels if it had not been for an accident in the breaking of a large limb from the top, in August. The apples have averaged about $2 a barrel.—Western Chronicle.

Apple Inspection.

As the season for marketing another good crop of ahples draws near fruit growers are anxious to be relieved from the present absurd system of inspection, and last year proved that more falsely packed apples were marketed and markets injured thereby than ever before.

Alter forty years experience in the business I am fully convinced that no system of inspection will be effectual or beneficial to both growers and consumers until we adopt the system used successfully in Nova Scotia for the past fifty years in the inspection of barreled fish, by which the inspector of barreled fish superintends the packing and brands the quality and his name on each package and becomes responsible for its contents.

If the government can be induced to adopt this system and appoint an inspector for each co-operative packing company, and discharge the army who have proved themselves useless as inspectors, both grower and consumer will be benefited.— James W. Bigelow, Wolfville, N. S. in Exchange

The maintenance of organic matter is of the greatest importance to the gardener. Humus is best supplied in stable manure. It is good culture to sow rye, vetch or clover on bare spots in late summer to keep the soil covered over winter. The great fault with many truckers is their dependence on commercial fertilizers.

Orchard Management in Relation to Fruit Farms.

Upon careful examination of fruit at fairs in the fall of the year one can generally tell what kind of treatment the orchard received during the year from which the fruit was collected. It is possible, however, to gather first-class show fruit from neglected orchards, but this is not the rule. The time is at hand when our fruit fairs are more representative of the kind of orchards that we maintain. And this is being more emphasized by the fact that people who win the prizes are those who give much care and attention in caring for the orchard throughout the year. The fruit shows it.

The spring of the year is the proper time to commence to think about and prepare for the fairs which are to be held in the fall. If one tries to grow exhibition fruit on all of his trees the chances are that he will have first-class fruit for market purposes. Competition is growing keener and it is now necessary in order to obtain the highest price to grow only the very best. In order to do this, careful attention must be paid to the various phases of orchard management. Careful individual study of each tree should be made to ascertain its vitality, general condition, etc. The first thing to be considered in the orchard is the sanitary condition, such as proper drainage, soil fertility, and the physical condition of the soil. One should see that the soil contains plenty of humus or decayed organic matter, since without this element plant food becomes unavailable, the soil does not take moisture well and does not hold it when it is applied.

One should look carefully after the pruning to see that the branches are stocky, capable of supporting a heavy load of fruit, allowing plenty of sunlight to penetrate, securing the proper spread and not allowing the tree to grow too high. All these will have much to do with securing a better grade of fruit for the market and the fair. The trees may require a very heavy thinning, this to be done some time during the latter part of June or the first of July. Thinning facilitates selecting and grading the fruit in the fall, as fewer culls and ununiform apples will have to be handled. When thinning, do not look at the apples which have fallen to the ground, but notice only those still remaining on the tree. See that each one is so located that it will not become limb-bruised, caused either by limbs or by wind. All wormy fruit should be picked off and destroyed. All doubles broken, as they often do not obtain the proper size and give the worms a better chance to enter on the side.

Fruit fairs should be patronized by every orchardist and it should be the aim of each to display the representative fruit of his orchard so that the total selection would be a fair representative of the locality. The orchardist should spend but a few minutes in selecting show fruit, but should bear in mind during the whole season that his object is to grow the best fruit possible on every tree, not only for show purposes, but for the market. In a way, every one likes competition, especially if he thinks he stands a show of winning, and it should be the object of every orchardist, not only to win premiums at the fairs, but to put upon the market the very best product that the market demands. Everyone likes to see and hear of honest advertising and there is no better way to do this than to grow show fruit that competes with the best, whether it be for the fruit fairs, or for the market. —R. S. Herrick.

Ladies!

WHICH appeals to you more? A *truth* backed by a bond of good faith, or a mere claim?

Judge this:

REGAL Flour yields the *best quality* and the *utmost quantity* of bread per barrel of any flour in the world. Costs a bit more but you save on the quantity it bakes. Lovely loaves, white and light. Fine flaky pastry too.

Essential point:

Try one barrel. If we have not here signed our name to the *truth*, your dealer will return your money. Then we must pay him. And worse still, we shall lose your good opinion forever. Remember—Regal—the flour that is used *exclusively* by many of the best bakers in the provinces.

DAIRYING.

Losses With Overripe Milk.

For the past four years the dairy department of the Ontario Agricultural College has been conducting tests to ascertain how much loss is sustained by allowing milk to become overripe or develop too much acid for cheddar cheese-making. There are objections to the methods followed in conducting these experiments, but as they correspond with factory conditions they are near enough correct for practical purposes, but are not scientifically correct.

The method followed was to take the milk arriving overripe at various times during the season and make this into cheese in the best manner possible, then compare these results with those on previous or succeeding days when the milk was normal.

There were made during the season of 1911, twelve experiments, seven of which were overripe lots, and five were normal. The seven lots consisted of 21,038 lbs. milk having an average of 3.41 per cent. fat and 2.22 per cent. casein. The five normal lots contained 6,743 lbs. milk, testing an average of 3.43 per cent. fat, and 2.19 per cent. casein—practically the same as the overripe lots. The percentage of fat and casein in the whey from the overripe lots were respectively, .171 and .085, while the wheys from the normal lots averaged .167 per cent. fat and .069 per cent. casein. The overripe lots remained in the whey for an average of 49 minutes, while the normal lots were in an average of 2 hours and 40 minutes.

The remainder of the results are shown in the table following:

	Normal Lots	Overripe Lots.
Lbs. cheese per 1,000 lbs milk	89.94	87.54
Lbs. milk per lb. cheese	11.11	11.44
Per cent. shrinkage at 1 month old	2.76	2.15
Per cent. moisture in green cheese	34.94	34.50
Per cent. moisture in cheese 1 month old	35.10	34.43
Average score for flavor (40)	37.76	35.07
Average score for closeness (15)	14.25	14.28
Average score for color (15)	14.43	14.28
Average score for texture (20)	17.52	16.95
Average score for total (100)	92.06	90.58

The normal lots produced an average of 2.58 lbs. more cheese per 1,000 lbs. milk, as compared with the overripe lots.

The normal lots of cheese contained higher percentages of moisture and the quality of the cheese was superior from the normal lots.

The practical lesson is that patrons of cheeseries should prevent so far as possible, milk becoming overripe, as such milk causes a loss of cheese making material and produces a poorer quality of cheese. The milk can be prevented from becoming over ripe by cleanliness, and cooling it to about 65 degs. F. on the farm.

Thick Cream Advantageous.

One of the problems in the cream gathering creameries is to get the patrons to skim a rich cream said Chief Geo. H. Barr, of Ottawa, Canada, in a recent address. In discussing this question at a recent meeting of creamerymen, several of our prominent buttermakers stated that it would be an injustice to the patrons of their creameries to offer a bonus for rich cream, as many of the patrons had separators which would not skim a 27 per cent. cream and do clean skimming. We regret that this is the case, as these farmers are losing much valuable feed for their stock.

What are the advantages of skimming a rich cream? (1) The buttermaker has a better opportunity to control the quality of his butter. (2) There is less cream to take care of at the farm. (4) There is a greater quantity of skim milk at the farm for feeding purposes.

The following table shows the benefits of skimming a rich cream in a herd of 10 cows, averaging 4,000 lbs. of 3.5 per cent. milk:

Total lbs. Butter Fat	Per cent. Fat in Cream	Extra lbs. Skimmilk on Farm.
1,400	20	—
1,400	25	1,400
1,400	30	2,338
1,400	35	2,996
1,400	40	3,500

It is difficult to get every patron interested in the quality of the butter at the creamery, but every one should be interested in retaining all the skimmilk possible on the farm, and it is simply surprising how indifferent and careless many are in this respect. If all the cream sent to our cream gathering creameries tested 30 per cent. fat, it would mean thousands of dollars extra money in the pockets of the patrons from more and better stock. I am safe in saying that the quality of our creamery butter would be very much improved, as some creamery-men would then pasteurize the cream who cannot do so at the present time on account of its low fat content and high acidity, which is the natural result of skimming a thin cream.

Cooling the Factory Milk.

The following resolution has been unanimously passed at recent dairy conventions, district dairy meetings and factory meetings:

'Whereas, in the opinion of this meeting, some definite temperature should be established for milk sent to cheese factories;

"Be it resolved,—That the night's milk for daily delivery be cooled immediately after milking, to a temperature of 65 degrees or under, and that the temperature of this milk should not be higher than 70 degrees when delivered at the factory. If for any reason it is found necessary to mix the night's and morning's milk, the night's milk under these conditions should be cooled to a temperature of 60 degrees Fahr. or under, immediately after milking, and milk so mixed should be delivered at the factory at a temperature not higher than 75 degrees F. To keep milk over Sunday for Monday morning delvery, it is recommended that the milk be cooled immediately after milking, to a temperature of 60 degrees or under, and held at this temperature until delivered at the factory."

Water Supply for Cows.

As a rule cows in the stable get sufficient water during the winter months. In the summer time they need much more owing to the evaporation due to the heat. Often the supply on the farm during the summer is below requirements and the cows are not able to obtain the necessary at their pleasure. It is a safe rule to provide at least five pounds of water for every pound of milk the cow gives. This will mean that at least twelve gallons a day should be supplied. Cases have been known where a cow would drink from twenty-five to thirty gallons in the warmest weather. Such a cow would likely produce 10,000 lbs. a year. Always the water should be pure and in winter shouid be warmed to sixty degrees. It is beter to warm the water yourself than to allow the cow to use up its food in so doing.

The Good Bull Pays.

Recently a valuable object lesson came to my notice in an account of a year's performance of a farmer's herd of 10 cows. The record of one of these cows is worthy of the careful attention of anyone engaged in dairying.

The ten cows averaged 5,073.2 pounds of milk for the year, with an average of 282.68 pounds of butter. The cow in question, although but two years old, gave 6,310 pounds of milk, and is credited with 372.88 pounds of butter. This increase of almost 90 pounds over the general average suggests an investigation of her breeding. Her dam and granddam were both members of the herd, their production appearing with the others, and so affording an opportunity for comparison. The granddam was a half-blood Jersey. She gave 7,447 pounds of milk and is credited with 312.12 pounds of butter for the year. She was breed to a three-quarter blood Jersey bull and the daughter produced 6,328 pounds of milk and 350.77 pounds of butter for the year. This cow, bred to a registered Jersey bull, produced the cow under consideration.

I have no information concerning the great granddam with which this chain begins. I assume that she was a native cow as good as the average of the herd. If so, the following tabulations show the influence of a pure-bred sire, assuming in these figures butter to be worth 25c a pound, and butter-milk and skim-milk to have a feeding value of 20c per 100 pounds.

312.12 pounds of butter at 25c	$78.03
7,135 pounds of butter-milk and skim-milk at 20c	14.27
Total value of year's production	$92.30

Her daughter should have credit for:

350.77 pounds of butter at 25c	$87.69
5,977 pounds of butter-milk and skim-milk at 20c	11.95
Total value for year	$99.64

The cow under consideration should be credited with:

372.08 pounds of butter at 25c	$93.02
5, 948 pounds of butter-milk and skim-milk at 20c	11.89
Total for the year	$104.91

The herd averaged:

282.68 pounds of butter each, at 25c	$70.67
4, 790 pounds of butter-milk and skim-milk at 20c	9.58
Total average for the year	$80.25

Were the ten cows as good as the subject of this article there would have been an increase in the yearly product of the herd of $246.60. When the ages of these cows are compared, still greater credit must be given this cow. The first-named cow was 10 years old, the second seven, while the cow considered was but two years old and milking with her first calf. It must be admitted that at maturity her capacity will have been materially increased, very likely one-half.

This suggests a scrutiny of the breeding of her sire. In his pedigree appear close up several well-known animals, notably the cow Eurotas 2454, whose butter record of 22 **pounds 7 ounces for one** week, and 778 pounds 1 ounce for a year, stamps her as the great cow of her time.

The importance of breeding to pure bred sires cannot be ignored. The improvement in this case began with a pure bred bull. Taking as a basis the figures assumed, there should be a credit for the years yield of the first cow tabulated of $12.05, while the yearly gain of the daughter of this cow and the bull of mixed breeding is but little more than half this amount. The bull last in use was not only a lull blood, but of potent

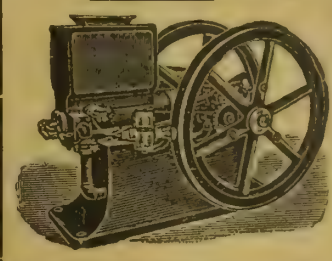
A New Name For The Best Farm Engine



Made in Air-Cooled or Water-Cooled Styles. Sizes 11-2 to 20 h.p.. Send for catalogue, prices and buying terms for farmers.

We have changed the name of our famous "CANADIAN" air-cooled and water-cooled engines to a name that also signifies quality.

Hereafter, these engines will be known as the "MONARCH."

It is a Monarch among farm engines. No engine runs better, is more compact, easier started, surer and steadier than this. Always remember the 'MONARCH.'

Every part is true to 1-500 in. or less. Experts work on each part. Material is the best money can buy. Bearings are big and wide, The design is compact, and every part is reachable. The "MONARCH" is reliable, simple, durable, powerful and dependable. Easy buying terms. Write us for catalogue. Our Company has a new name, too :—

LIVE STOCK.

Sheep Husbandry in Canada.

Coincident with a number of other active agencies designed to revive the sheep raising industry in Canada, there has been issued by the Live Stock Branch of the Department of Agriculture a new edition of that exhaustive and practical treatise 'Sheep Husbandry in Canada' which received such a warm reception some four years ago. This work of 126 pages, which constitutes a report as well as a helpful bulletin of instruction, covers the history and condition of the sheep industry in every province, pointing out the weak points and offering useful information for the guidance of older shepherds as well as those who are just beginning, or desire to begin, raising mutton and wool. In this work the author, who is a trained sheep man, brings out clearly the great advantages of keeping sheep from the dual standpoint of direct profit in cash returns, and the even more important indirect one of cleaner farms and better crops. Then there is a special section, 'From the Block to the Table' designed to popularize the consumption of mutton and lamb. Other sections deal with weed destruction by sheep, diseases, wool, housing, enemies, breeds and breeding, feeds and feeding, and other important matters. Under 'The Industry in the Different Provinces' some startling new facts, concerning the profits made from sheep, are brought out. It is shown that a flock of about 150 ewes worth $6 each, after housing, feeding and care were charged against them, gave in 1911 a profit of more than $600. This occured on a Manitoba wheat farm.

A special feature of this bulletin is its many beautiful illustrations in sepia tints, many of which are worth framing. A large issue has been printed to be supplied free to those who apply for it to the Publications Branch, Department of Agriculture, Ottawa.

Raise the Good Calves.

The calves must be taken care of if the beef and dairy animals are to be raised in sufficient numbers to supply the increasing demand. The practice of selling the calves as soon as they are old enough for beef must not continue if we are to have enough animals on our farms to stock them sufficient to justify mixed farming.

The most progressive dairymen of the country find it profitable to raise their own cows. Many ranchmen get profits from raising beef cattle, then why cannot a farmer who has a fair pasture and plenty of supplementary feeds raise calves economically?

One difficulty with many farmers is that their animals are not worth raising. Under present conditions it is doubtful whether or not scrubs, either dairy or beef type, are profitable to raise. The best of either type would undoubtedly pay, provided, of course, the manager is prepared, having pastures and feed.

There is a great need for the butchers or the packers to get many of the dairy cows now kept on farms. They are fit for no other purpose and would not be taken for beef were it not for the scarcity of beef animals.

The scrub cow and the scrub bull must forfeit their right to a place in the pasture. They have been weighed in the balance and are found wanting. When standard-bred bulls of excellent conformation and prepotency are substituted and standard-bred cows or extra grades used instead of scrubs, the calves may be raised profitably.

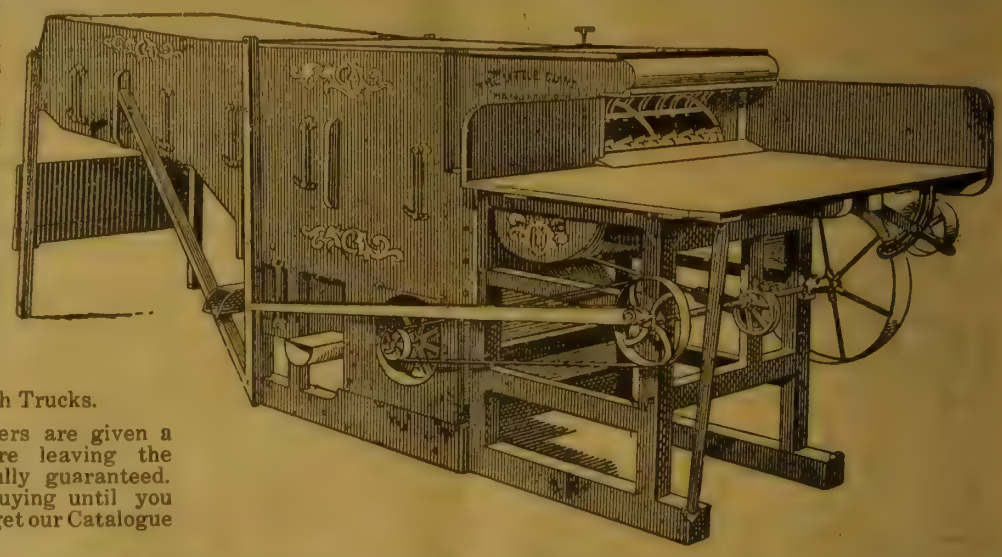
Handling the Bull.

'As a rule, the bull hands back to a man on the points of his horns the exact treatment accorded him at the points of the pitchfork prongs,' pointedly says Dean R. S. Shaw, of the Michigan agricultural college. 'The club has no place whatever in the handling of a bull, and the same is also true of boisterous conduct of any kind on the part of the attendant. Quietness and gentle, but firm, treatment are essential to the proper training of the bull. Never undertake to make the animal do anything without accomplishing the same. If there should be any question about the result do not undertake it. The man who is afraid of a bull should not attempt to manage him, as the bull will detect the first evidences of fear and begin to take advantage at once, finally becoming ungovernable. On the other hand, no man should pursue foolhardiness and expose himself to danger unnecessarily.'

The Indications are that We Will Have a Bumper Grain Crop this Year

THEREFORE IF YOU HAVE A LOT OF GRAIN TO THRESH FOR YOURSELF OR, IF YOU WANT TO MAKE MONEY THRESHING CRAIN FOR OTHER PEOPLE, IT WILL PAY YOU TO BUY ONE OF OUR LITTLE GIANT THRESHING MACHINES.

The accompanying is an illustration of our Two Horse Thresher. Since gasoline engines came in use, the sieves of this machine have been enlarged about 30 per cent. This gives greater cleaning capacity and is very essential for the thorough cleaning of the grain. Many other improvements have also been made.



The Little Giant is in four different sizes; one horse, two horse, four horse, and eight horse power. Either of these machines, from two horse power up, can be supplied with Tailings Elevator, Bagger, Straw Carrier, or with all, if desired, and can also be equipped with Trucks.

All our Threshers are given a thorough test before leaving the factory and are fully guaranteed. Do not put off buying until you require a Thresher; get our Catalogue and prices at once.

Be sure and see our exhibit in the Machinery Hall at the St. John Exhibition, Aug. 31st to Sept. 7th

SUSSEX MANUFACTURING CO., Ltd., SUSSEX, N. B.

This Iron Age Potato Digger

is easily operated by two horses and will please the most critical in its work. It has many advantages over other makes of diggers, such as ease in draft and ease to keep on the row, absolutely no bruising of potato and dig as many as you like before picking up. The machines of Bateman Mfg. Co. have been on the market for 76 years and are warranted to give satisfaction. Write for catalogue and prices.

"INTERNATIONAL FLY WAY"
Prevents the Tremendous Loss from Flies

Flies cost the Farmers of Canada millions of dollars annually by retarding the growth or fattening of animals and by greatly reducing the production of milk by constantly annoying the animals all summer. Every farmer or stockraiser knows this statement to be true from his own experience.

Flies also cause a great loss of life by Spreading Diseases from farm to farm. "International Fly Way" will keep flies off your animals and give them perfect rest from these pestiferous insects, which will make you more money in a larger production of milk or much quicker growth of all animals.

SAVE YOUR STOCK
By Using
"INTERNATIONAL FLY WAY"

It is positively guaranteed to be effective in Driving Away Flies, Mosquitos, and other insects which worry stock and reduce their earning capacity. It is harmless to the hair and skin and will be found perfectly satisfactory when used according to directions.

We place our twenty years of reputation back of "International Fly Way," and ask you to test it on our positive guarantee.

FOR SALE AT ALL DEALERS.

INTERNATIONAL STOCK FOOD CO. Limited, TORONTO

No. 74

Sheep Breeding.

The first factor to consider in this connection is the environment. If the stock grower aims to secure the maximum profits from his investment he will, when laying the foundation of a flock carefully consider the adaptability of the different breeds to his locality or to his own farm. The principle indicated has, perhaps, received more attention in Great Britain than else where, with the result that the breeds developed are the best suited to their respective districts. Evidently the British farmer is not governed by whims. He has chosen families bred in his section that are the most suitable for his soil, proved these by selection and the proper sort of males, never losing sight of his environment. Hence in Shropshire we find nothing but S Stropshire we find nothing but Stropshire sheep. In the North of England and in the South of Scotland the Leicester families prevail. Farther up in the hill country we find the Cheviots and again in the higher and more barren hill country we find the Highland or Blackface Sheep. In the southwest of England are the various classes of Downs and other breeds which have proved through succeeding ages the best suited to the districts. Unfortunately the wisdom of this practice has been largely disregarded on this side of the Atlantic and the beginner allows his fancy for a certain breed to guide him in making a selection which after a few years' experience he perhaps discovers is entirely unsuited to his environment and in order that his flock returns be satisfactory is forced to change breeds and start all over again.

Another important factor in successful sheep breedng is continuity. Having obtained the breed that is best adapted to local conditions, don't change. No breeder should be content with merely holding his own, for in nine cases out of ten if he doesn't advance he will retreat. As in any other business, the most aggressive man is the successful, other things being equal. The breeder should have an ideal of perfection raised sufficiently high to give zest to his ambition and then strive to get there. By a rigid system of selection he can gradually raise the standard of his flock and find himself engaged in an interesting and useful work to which a life time may be devoted. The history of breeding in Great Britain furnishes many examples.

There it is a common thing to find a farm on which Leicesters have been bred from 60 to 100 years. Messrs. Mansell, of Shrewsbury, who are famous as breeders of Shropshires, have continued in the same family on the same farm for 60 years.

But even supposing a breed has been wisely chosen and the owner continues in his efforts along the same line for a considerable period there still remains a possibility that the standard of perfection towards which he is working is not the most desirable. He may be paying too much attention to lads and neglecting the utility of the animal. This is one point that should always be foremost in the mind of the stock breeder. The power behind the whole business is the market requirements. We breed sheep to supply the consumer with the particular quality of wool and mutton that he demands. The next consideration is to supply this demand in the greatest quantity and the best quality for the food consumed and the care given.

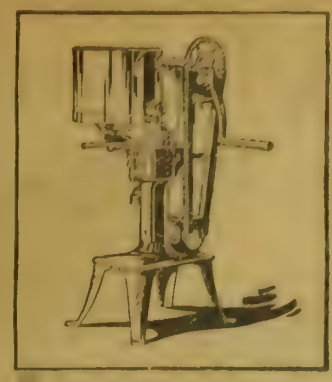
While hundreds of years of experience has proved that nothing but pure-bred animals are suitable for breeding purposes, it frequently happens that "crossing" is resorted to in order to produce market lambs. This is a feature of breeding that is very much misunderstood by many farmers. In Great Britain it means the selection of ewes of a certain breed which are crossed with the male of another breed in order to produce lambs of better feeding and selling qualities than is the case with some pure-breds. For instance, Cheviot ewes are sometimes crossed with Down rams and sometimes with Wensleydales and others of the Leicester families. To keep a constant supply of Cheviot ewes a number of the best animals are mated with best Cheviot rams. These are kept for breeding purposes while the cross-bred animals are sold to the lowland farmers for fattening. In America crossing has too often been abused. Frequently when a breed has been given no consideration as to its adaptability to a certain environment and does not come up to expectations it is crossed with another breed; not producing satisfactory results it is crossed with still another breed, and so on, until finally the flock is of such a nondescript and irregular character as to be of no value to the breeder or feeder, and an absolute injury to the market where it may be sold. Hence the best results can only be obtained by a study of envirobment, continuity, utility and crossing which, if applied to the operations of every breeder would soon give this continent a reputation equal to that already won by the shepherds of Great Britain.—J. Hugh McKenney

Minard's Liniment Co., Limited.

Gentlemen,—In June, 98, I had my hand and wrist badly bitten and badly mangled by a vicious horse. I suffered greatly for several days and he tooth cuts refused to heal until your agent gave me a bottle of MINARD'S LINIMENT, which I began using. The effect was magical; in five hours the pain had ceased and in two weeks the wounds had completely healed and my hand and arm were as well as ever.

Yours truly,
A. E. Roy,
Carriage Maker.

St. Antoine, P. Q.



IHC
Cream Separators Have Trouble-Proof Neck Bearings

GRANTING that a cream separator is a money making necessity on every farm where three or more cows are kept, there are two points to make sure of when you purchase your machine—close skimming and long life.

There is very little skimming difference between separators when new but there is a tremendous difference in the length of service they will give. The difference is due to design and mechanical construction. To take one example of mechanical efficiency

IHC Cream Separators Dairymaid and Bluebell

have trouble proof, self aligning, bowl spindle bearings. The bowl spindle bearing or neck bearing is an extremely important part of the separator mechanism. Its business is to reduce to the lowest possible point the vibration of a heavy bowl whirling at the rate of 6,000 or more revolutions per minute. A rigid bearing in such a place is impossible. To make a flexible bearing capable of withstanding the terrific strain requires the most accurate balance of strength, firmness, and elasticity. In I H C cream separators this balance is acquired by the use of one spring. There is only one wearing part, a phosphor bronze bushing. The entire bearing is protected from dirt or milk by steel cases. There is but one adjustment and that easy to make.

Go to the I H C local agent who handles these machines and ask him to show you how successfully this bearing meets all the difficulties imposed upon it. He will also show you many other reasons why I H C cream separators, made in four sizes, are the best. Get catalogues and full information from him, or write the nearest branch house.

THE HORSE.

Treatment of Sprains.

Lecturing before the Eastern Counties Veterinary Medical Association, Mr. Wm. Hunting, F.R.C.V.S., gave some useful information as to treatment in cases of sprain in horses. In regard to sprains of the ligaments of joints or inflammation resulting from bruises, there was, he said, tearing or stretching of ligaments with synovitis. Effusion took place into the joint and surrounding tissues. The object in treatment was to check, if possible, the effusion, and then to allay pain and promote absorption. Repair took place when the inflammatory process had subsided, and the less the effusion among the tissues the more thorough was the repair.

In the very ealiest stage of a sprain, cold in the form of continuous irrigation, may check the effusion, but this stage was seldom or never seen by the veterinarian, and could not last many hours. When inflammation had reached the stage at which the blood in the vessels is almost stationary and effusion plentiful, cold was likely to do more harm than good. This stage of the case required warm fomentation, to allay pain and to establish an active circulation in the surrounding blood vessels of the damaged part. For a day or two that might be continued, and then resort should be had to dry even pressure, with gentle massage. Pressure was applied by means of a linen bandage with a good thick layer of cotton wool between it and the joint. The bandage should be removed at least every twelve hours, and left off an hour or two. The massage should be done with the hands—a gentle firm pressure in one direction—with the hair. As soon as the horse could stand fairly on the lame leg walking exercise should be commenced, with a duration, say, of ten minutes at first, and gradual extension every day unless pain is increased. The horse should, of course, be in a loose box, not tied up.

Where some enlargement remained and the motion of the joint was limited, the worst thing to do was to limit active motion by not exercising the horse, and the next worse treatment was to blister. To blister the swelling caused by a bruise or a sprain was almost certain to render it permanent. In addition to massage, a joint that is limited in its motion by effusion or by fibrous thickening should be forcibly, but not violently, flexed and extended for some minutes every day.

Bruises.

Bruises are nothing but contused wounds, where the skin has not been ruptured. There is often considerable solution of continuity of the parts under the skin, subcutaneous hemorrhage, etc., which may result in local death (mortification) and slough of the bruised parts. If the bruise or contusion is not so severe, many cases are quickly cured by constant fomentation with hot water for from two to four hours. The water should be allowed about this time to become gradually cool and then cold. Cold fomentation must then be kept up for another hour or two. Dry the parts thoroughly and quickly, and bathe them freely with camphor 1 oz. sweet oil 8 oz., or with equal parts of lead-water and laudanum. A dry, light bandage should then be applied the horse allowed to rest, and, if necessary, the treatment may be repeated each day for two or three days. If, however, the wound is so severe that sloughing must ensue, we should encourage this by poulticee made of linseed meal, wheat bran, turnips, onions, bread and milk, or hops. Charcoal is to be sprinkled over the surface when the wound is bad smelling. After the slough has fallen off the wound is to be dressed with warm antiseptic washes of carbolic acid, chloride af zinc, permanganate of potash, etc. If granulating (filling up) too fast, use burnt alum or air-slacked lime. Besides this local treatment, we find that the constitutional symptoms of fever and inflammation call for measures to prevent or control them. This is best done by placing the injured animal on soft or green food. A physic of Barbadoes aloes, 1 oz. should be given as soon as possible after the accident. Sedatives, such as tincture of aconite root, 15 drops three times a day, or ounce doses of saltpetre every four hours may also be administered. When the symptoms of fever are abated, and if the discharges from the wound are abundant, the strength of the patient must be supported by good food and tonics. One of the best tonics is as follows'—Powdered sulphate of iron, powdered gentian and powdered ginger, of each 4 ozs. Mix thoroughly and give a heaping tablespoonful twice a day, in the feed or as a drench.

Practical Breeding Principals.

The substance of a paper by J. Cossar Ewart on the "Origin of the Clydesdale and other Heavy Breeds of Horses" published in the Transactions of the Highland and Agricultural society of Scotland is given in the Canadian Bulletin of the International Ageicultural Institute, as follows:

From anatomical studies of fossil and living races of horses, it seems evident that our modern heavy breeds are not descended from a single prehistoric race but are a blend, in most cases, of three perfectly distinct wild races.

If Clydesdales, like thoroughbreds, notwithstanding domestication and artificial selection, are really a which refuse to blend to form a pure-mixture of several distinct types breed, it is evident that breeders of Clydesdales, like breeders of thoroughbreds, should avoid having too many "free generations" between the sire and dam; in other words, they should, unless for special reasons, avoid crossing distinct types.

Having by accident or design secured a good strain, they should endeavor to maintain the strain in all its purity. On the other hand, breeders who have indifferent strains should bear in mind that it is possible, by working on Mendelian lines, to engraft on their strain the points (e. g. good shoulders) which appreciably increase the value of other strains. By mating unrelated mares with a stallion having the points desired, and then interbreeding the offspring or mating their fillies with a half-brother (out of an unrelated mare of the right type) from another stud, they will have a good chance of obtaining what they desire.

It may be added that breeders of heavy horses might well bear in mind that animals with hoofs and limbs of the "steppe" or "Siwalik" type are more likely to stand the wear and tear of city life than animals with broad hoofs, round cannon bones, and hairy heels, inherited from a "forest" race, adapted for the moist pasture lands and peat-bogs which prepailed in Central Europe in prehistoric times.

Horsemen Attention!!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'SCONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevets the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR:—I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

DEAR SIR:—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of theshoof.

POULTRY.

Washing Fowls.

Most fowls, black, white, blue, yellow, or parti-colored, are the better for a wash occasionally before being exhibited. It produces at the time a soft, feathery look, which should determine whether, in the case of colored fowls, washing would be an advantage or not. A black hen, such as a brown red game Bantam hen, would, if she had knocked about a great deal, be brightened up by a wash, but in the case of a cockerel of the same breed, it would mostly be shown unwashed, as we want its saddle and other similar feathers to look as close and hard as possible. Pyles, however, are always washed, and it cannot therefore hurt any game bird to have an occasional dip. And as for soft-feathered birds, especially those where fluff is a feature, they are certainly improved by washing, no matter what color they are, unless they have been carefully kept up from show to show in plenty of straw or similar material. The fact, however, remains, that thousands of birds are exhibited unwashed, except as regards their feet, legs, heads, etc.

At this season of the year it must be remembered that the birds have about them (the chickens, I mean) quite a large quantity of pin feathers. And if the scrubbing in the tub be too roughly done these feathers will be left behind in the water, and more or less thin places or altogether bald patches will be seen on the birds. So that hand-washing is preferable to much scrubbing with a brush. The head will generally stand a little more rough work than the other parts. A good brushing brings up the coral of the face, but care must be taken that white lobes are not too severely treated.

If, then, the washing be continued down from head to tip of tail, getting the dirt out by hand massage, all will go well. A beginner seldom gets over the lower breast, thighs and rump as clear as does the old hand. He allows the dirty water to settle down into these parts. And when the bird is dry and the evil is palpable he comforts himself with the reflection that the dirty perch has worked the mischief.

Another evil is failing to get the soap out. This completely ruins the bird's appearance. Crude soap should never be rubbed on the feathers. A good lather is all sufficient, and it comes away well with three waters. But an absolute beginner is well warned if he be told to use four waters, and see that his tubs, bowls, etc., are well rinsed out between the emptying and refilling. Better far to use one water too much than one water too little. For white fowls don't overdo the powder blue. Tie a little up in thin cloth or muslin and just move the bag about in the water till the water is nicely blue. In this way no more blue dissolves out than is necessary.

Squeeze all water out of the saddle and rump feathers with the hand. Dry off with towels, but before a reasonable fire. If too scorching, screen with a newspaper or sheet. Aim at a gradual moist heat, not a brisk dry one.—The Poultry World.

The Moulting Process.

The process of moulting—that is, growing a new coat of feathers— is common to every bird, consequently it is apt to be taken as a matter of course, and the owner of the fowls is not always aware that it can be delayed or hastened, made easy or difficult, dangerous or the reverse, according to the way the fowls are treated. It is quite true that when wild in the jungle, fowls moult without any other aid than that of Nature; but fowls in the jungle and fowls under domestication are so different as to conditions of food, shelter, and climate, that they must almost be different species. Under ordinary circumstances an adult fowl grows an entirely new coat of feathers once a year. The younger the fowl the earlier and more rapid the moult.

For farm birds an early moult is highly desirable, as only birds that moult early can be expected to lay during the time prices are highest.

If for any reason it is desired to delay the moult, this can be brought about by giving the birds food very rich in albumoids or flesh-forming matter, such, for example, as pea-meal, malt sprouts, or cooked liver, in addition to the ordinary food, and avoiding foods of a starchy nature, such as maize or maize-meal, potatoes and barley meal. The house in which they are kept must be as airy as possible, and, if trap nests are used, care must be taken not to allow the hens to remain in them longer than necessary, as nothing so quickly induces broodiness, and if the hens are allowed to go broody, the moult soon begins.

On the otaer hand, it is often desirable to hasten the moult, and although it is unwise to interfere too much with the ways of nature, a good deal can be done to help the moult without any injurious effects following. The safest plan is to get the birds into very lean condition by reducing the usual quantity of food by about one-half, as lean birds moult much more readily than those that are fat. The process may, however, be still further hastened by shutting the birds up in a small house, which is very hot owing to the number kept, and it will be all the better if it is exposed to the heat of the sun. This is a very favorite practice with exhibitors when they want their birds ready for any particular show that might occur in autumn before the natural moult was quite over. By far the most effectual way, however, is to allow the birds that are broody to sit on the nest for a fortnight or three weeks, giving them first a handful of corn a day during that time. They will moult after two or three weeks, and be ready to lay quite early in the autumn.

As soon as the birds are pretty bare of feathers, and the pin feathers are seen coming through the skin, the food may be gradually increased until the birds are on full rations again. They will be found very hungry—quite as hungry as hens in full lay, and the food should be of a nutritious nature, and not too fattening If fattening at this period, a poor winter egg supply will be the result. A handful of linseed in the soft food is a help, but this must be withheld from white plumaged birds that are wanted for show or sale, as it makes the plumage quite yellow. Iron, which is a valuable tonic at this period must be avoided for the same reason. In the case of birds that will

(Continued on page 778)

Buy Certainty With Your Wagon

THERE is no longer any need to speculate in wagons. Before you buy a wagon you can be sure of the quality of wood in hubs, spokes, felloes, axles, bolsters, stakes, and boxes; of the weight and quality of metal in tires, skeins and ironing. I H C wagons

Petrolia **Chatham**

are the easiest running, longest lasting wagons you can buy because the lumber used is carefully selected—first grade oak and hickory for wheels, the finest yellow or bay poplar for box sides, and the very best long-leaf yellow pine for box bottoms—all free from shakes, checks or other defects which would interfere with their giving the best service.

The construction of I H C wagons is worthy of the good material used. The air-dried lumber is machined swiftly by accurate, automatic machines, doing the work uniformly well and at a cost away below that of turning out wagon parts by old fashioned methods. The saving thus made is returned to you in better quality of material. All joints fit snugly. Skeins are paired, assuring easy running. All ironing and other metal parts are extra thick and strong.

Go to the I H C local agent who handles these wagons and ask him to prove our claims. Remember, that our responsibility does not cease when the sale is made. You are the person who must be satisfied.

The I H C local agent will show you the kind best suited to your needs. See him for literature and full information or write the nearest branch house.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Selling the Farm.

Well, yes, we settled, ma and I, that
we would sell the farm;
We are getting on in years, and it
has somehow lost its charm.
So we said we thought it time to let
some of life's burdens down,
And the married children thought we
ought to buy a home in town.

Well, a purchaser come right along,
for I'll own, I'm free to say,
That a better or a prettier place you
might search for many a day,
With it's fertile fields and wooded
hills and meadows lush and green,
And buildings snug and neat and trim
as any ever seen.

But it's strange how old familiar
things will twine around the
heart,
And we never dream how close things
cling till we sense that we must
part,
And when it come to business, sir,
that's what I meant to tell,
We found a precious lot of things that
somehow wouldn't sell.

There's that willow that ma planted
some forty years ago;
It has grown into a mignty tree w th
branches drooping low,
And the children played beneath it's
shade when the days were long
and warm—
Now I wouldn't sell that willow tree
for the price of this old farm.

And its curious how we grow to love
the things we plant and tend—
Every tree in that old orchard seems
just like a human friend.
And I couldn't help but meditate how
we'd miss them, ma and I,
The tree of Golden Pippins and the
hardy Northern spy.

And then the preeious memories that
cluster 'round the place.
They seem to fill these homely rooms
with beauty and with grace.
We could seem to see the children flit-
ting blithely here and there,
And to hear their merry voices caling,
calling everywhere.

Then one day I found ma sitting by
the rose bush at the door
With the wistful look upon her face
I'd noticed there before,
And I just dropped down beside her
and she looked up at me,
And something blurred our dim old
eyes till somehow we couldn't see.

And then we settled, then and there
that we'd stay on this old place
Till the Lord sees fit to call us to
stand before his face,
And we're mighty glad to tell you,
sir, we have no desire to roam,
For we think we know just what it
means to sell the old farm home.
—Elizabeth Clarke Hardy.

Out of the House of Bondage.

(Continued from last issue.)

There were three people to whom sleep did not come that night: Rose Henderson, because she was too happy, Joe Campbell, because he was too perplexed; and his mother, because she had to think things out. She had thought before morning; the next day she sent a message tp Rose.

Rose came at once, timid and trembling, yet blissfully happy. Jane Campbell, propped up against the pillows, her sharp eyes full of inscrutable purpose, held out her hand.

"Come here, child," she said. "How pretty you are! I don't wonder Joe fell in love with you."

Rose, blushing, went to the bedside put her hand in the small one which closed about it like a trap.

"I suppose," Jane Campbell said, holding her fast, "that you think you love Joe."

"Oh, I do!" little Rose cried earnestly.

Joe's mother shook her head. "You're too bright and pretty for a sober, plodding fellow like Joe," she said. "Don't you know that, child?"

Rose's slender figure stiffened, and her brown eyes flashed.

"I'm not half good enough for him!" she cried. "There isn't anybody good enough for Joe."

Jane Campbell laughed softly.

"There, child I was only joking. Do you suppose his mother doesn't know what he is? Think what he's been to me these six months! It—it almost kills me to be a drag upon happiness."

Rose looked at her in perplexity, half upon the defeasive still, half yielding to pity. Jane's face had softened, and the whole small, helpless figure was full of pathos.

"For his mother to chain him down!" she murmured.

It was too much for Rose. "But you don't!" she cried. "You couldn't. Joe loves you better than anybody!"

"You generous little thing!" Jane said, smiling bravely. "And it's only a little while—I'm sure it can't be long—and he— both of you—will be glad afterwards. But to have your engagement put off even for a day, for me—"

Rose's pretty brown eyes met the keen blue ones with wide wonder.

"That isn't anything when—we know," she said. And, poor child, she really supposed that it wasn't.

They had a long afternoon together—Jane affectionate, sorrowful, appealing; Rose loving and pitiful. Yet when she left she was somehow sure, though she could not have told why, that it was not right for her and Joe to be engaged. She told him so when he came around to see her that night.

"But we can't help being!" Joe cried. "We know, and its the knowing that makes us."

Rose sighed, and a shadow fell across the brightness of her face.

"Nothing can ever change that; Joe," she said wistfully; "but, somehow I felt sure this afternoon that it wouldn't be right. Your mother needs you so, Joe, and it would seem like taking you away. She may grow better soon, and we're young—we can wait."

"But when shall I see you?" the poor fellow cried.

"There's Sunday," Rose said steadily.

"Sunday!" Joe retorted passionately. "A ten-minutes walk one a week! Rose, I must come over one evening, any way. It isn't fair to either of us not to—mother herself would be the first to say so."

"Are you sure?" Rose asked, brightening.

"Sure," he returned positively.

Jane Campbell was very thoughtful when she learned of the arrangement, but she did not try to interfere. And so for two years—nearly three—Rose and Joe lived upon their one evening and ten minutes a week, with an occasional stray gift of fortune in the way of unexpected meetings. Then Joe grew restive. Jane saw it coming. She clinched her small hands underneath the bed cloths and waited.

"Mother," Joe said, "I want to get married next month."

"I—I wish you could, Joe," Jane faltered.

Joe strode across to the bed and stood looking down at her, half pitiful, half triumphant.

"But I can, mother. I know it seems a great deal in one way to ask of a girl, but Rose loves you so—why, mother!"

"It's—its nothing," Jane declared fiercely—"nothing. Go on; you were saying—?"

But Joe would not go on. He quited her and then ran for Dr. McGruder. The doctor looked troubled when Joe explained.

"Has anything happened to excite her?" he asked.

"No—yes—I was speaking of getting married," Joe confessed.

The doctor frowned and pulled his heavy red beard.

"It's hard on you, Joe," he said—"confoundedly hard; but I'm afraid she'll have to be kept quiet for a while. You and Rose can wait a little longer, can't you?"

And Joe answered instantly, "of course we can," but suddenly all the light went out of the day.

He and Rose had a long talk the next night, though it wasn't their evening, and Rose at once declared that they must wait until the doctor said Jane could bear the excitement.

"If she'd only let me do things for her!" Rose sighed, with quivering lips; but she knew—they both knew—that Jane would not.

So they waited a year longer, and when the year was over it still seemed necessary to wait a second year. Then at last they set another day. Rose's clever little fingers began to dream over the wedding gown (begun four years before), and finally, one glorified morning, Joe went over to Canaan for the license. The day was still nearly four weeks off, but it made it seem nearer to have the license. He stopped at Miss Parson's on the way home, and in the little, stuffy, hair-cloth parlor the two of them read it together.

"It doesn't seem possible, does it?" Joe asked. He was almost trembling himself, big fellow though he was,

But little Rose looked up at him bravely, ignoring the color that flooded her face under his shining eyes.

"I told you it would come right, Joe," she said.

Joe went on through the summer afternoon. The air was full of swarms of tiny, gauzy-winged creatures, flecks of rainbows, whirling through their dizzy hour of life; but Joe never saw them, so much more dizzy, so infinitely more radiant, was the whirl of joyous hopes and plans within his heart. Half-way home he met Dr. Pemberton, trudging down the opposite side of the street. He stopped short when he saw Joe's face, and then crossed over.

"Hello, Joe!" he said. "You look as if you'd fallen heir to a cottage in paradise.."

"I guess I have," Joe answered. "It's only three weeks and five days —I got the license today."

The old minister pulled off his hat and waved it boyishly around his white head.

"That's the talk!" he cried. "Come up and tell me about it tonight, Joe I've got to go and see Martha Davis now. Her constitution requires a minister once a week."

But Joe did not go that night; it was the next evening, just at dusk, that he walked heavily up the path. Theold minister called out a cheerful bidding to enter, but when he saw Joe's face the welcome died on his lips.

"What's happened, Joe?" he cried.

Jee dropped into a chair; his eyes were hard and dispairing.

"It's mother again, somehow, yesterday she fell over the edge of the bed and dislocated her shoulder. Doctor says it will be a slow business. Mother is suffering badly, though she doesn't complain a bit. She—she feels so badly about putting off the wedding. Joe said it steadily, not looking at his friend.

"But, Joe," Dr. Pemberton cried excitedly, "it's got to be! You and Rose have waited too long—you've waited five years too long already. Tell Jane it's got to be—bolster her up and get married anyhow."

Joe shook his head. "She wants you to come down and see her," he said dully.

"Come down? Of course I'll come down," the little minister stormed.

"I'll come down and say things—that's what I'll do. You just hold on a minute, Joe."

Joe waited while Dr. Pemberton pulled off his old flowered dressing gown and put on his coat, and then the two set off down the hill together in a silence that was the heart of comradeship. Only when they reached Joe's gate the old man turned and wrung his hand.

"Don't you worry Joe," he said. "We'll fix it somehow."

But he didn't. When he saw Jane Campbell's pain-drawn face, he knew with a sinking of the heart that,

DOCTORS ADVISE OPERATIONS

Saved by Lydia E. Pinkham's Vegetable Compound.

Swarthmore, Penn. — "For fifteen years I suffered untold agony, and for

one period of nearly two years I had hemorrhages and the doctors told me I would have to undergo an operation, but I began taking Lydia E. Pinkham's Vegetable Compound and am in good health now. I am all over the Change of Life and cannot praise your Vegetable Compound too highly. Everywoman should take it at that time. I recommend it to both old and young for female troubles."—Mrs. EMILY SUMMERSGILL, Swarthmore, Pa.

Canadian Woman's Experience:

Fort William , Ont.—"I feel as if I could not tell others enough about the good Lydia E. Pinkham's Vegetable Compound has done for me. I was weak and tired and I could not rest nights. A friend recommended your Compound and I soon gained health and strength and could not wish to sleep better. I know other women who have taken it for the same purpose and they join me in praising it."—Mrs. WM. A. BUFFY, 631 South Vickar Street, Fort Williams, Ontario.

Since we guarantee that all testimonials which we publish are genuine, is it not fair to suppose that if Lydia E. Pinkham's Vegetable Compound has the virtue to help these women it will help any other woman who is suffering in a like manner?

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

THE ST. JOHN BUSINESS COLLEGE

S. KERR Principal.

"I was cured of diarrhoea by one dose of Chamberlain's Cholic, Cholera and Diarrhoea Remedy," writes M. E. Gebhardt, Oriole, Pa. There is nothing better. For sale by all dealers.

whatever it may have been other times, there was no "fixing it" then. So he only sat by her bedside a few minutes and talked cheerfully, and then carried her with her suffering up the path to a throne where his old feet went many times a day with his people.

Joe was getting supper in the kitchen, and disappeared into the pantry as the old minister opened the door; by which sign his friend knew that he had reached one of the ways that one must walk alone, and, closing the door, the minister softly stepped out into the dusk. A little way down the street the doctor picked him up.

"Been down to Jane's?" he asked. The minister nodded; he looked old and tired.

"James," he asked suddenly, "did she do it herself?.'

"Heaven unows," the doctor answered gravely.

"She's paying for it if she did," Dr. Pemberton said slowly.

"She's making Joe pay," the doctor retorted grimly.

The little minister turned sharply. "She's paying for it," he repeated. "Man, did you think I meant her body?"

"I wish Joe would pick Rose up and elope with her," the big doctor grumbled. "It would be the only way."

"I think Joe would be willing to,' the minister returned, "but—there's Rose."

Yes, there was Rose, and as the weeks wore away, Rose's two old friends began to watch her anxiously; for the pretty sparkle had all died out of her eyes, and a quiet hopelessness dwelt in them. Rose indeed had given up hope. She came slowly up the hill to the old minister one afternoon, but when she got there she only sat beside him on one of the garden benches, staring heavily down the row of four o'clocks. Suddenly she looked up into the grave, loving eyes.

"It—it isn't for myself I care!" she cried passionately. "Oh, don't think that! It's Joe. He's getting so worn, and it's so hard on him doing things at home. It isn't right for a man to. I wouldn't care how his mother treated me if only I could go and make things easy for Joe."

"Who," the minister said cheerfully, "is coming in the gate this minute. I wonder if you can take care of him while I finish a bit of work in the house. Keep him till I come back—tell him I want to see him."

Joe came slowly up the path. He did look badly; his broad shoulders had lost their old confidence and were beginning to sag a little; but when he saw Rose his listlessness vanished. Troubled as they were, neither of them could deny joy for a few blissful moments in a summer garden. The old minister waved his hand to them and disappeared into the house; a curious excitement had come into his manner.

"Lord," he said, "Thou knowest we are meddlesome by nature, and prone to take Thy tasks upon ourselves as the sparks fly upward; but I've been praying for light five years and—I'm going to do it!"

He gave an order or two in the kitchen, puttered about a little, and then went back to the garden. The young people rose as he came down to them, and he stood looking at them, a queer, wistful smile on his old face.

"Aren't you and this little girl about ready for me, Joe?" he asked.

"Ready!" Joe groaned. "Sometimes," he said fiercely, "I think I'll pick her up and bring her to you, whatever happens."

The old minister's face grew more earnest. His sister and Molly were coming down the path with a tray of cakes and raspberry wine, but he did not notice them.

"Would you go, Rose?" he asked.

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition
It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

"It—it might be easy, child. Would you go?"

Rose looked up at him, her eyes darkening into sudden tears.

"Do you remember what I said half an hour ago?" she cried, her voice breaking suddenly.

The old man put a hand—a wise, tender old hand—upon each of theirs, and his voice strengthened and filled with solemn joy.

"Then," he declared solemnly—"then, Joseph and Rose, I hereby pronounce you man and wife; and whom God hath joined together let no man put asunder."

There was a moment when the buzzing of a bee in the hollyhock beside them sounded loud across the startled silence. Then the old minister said gently: "Let us pray."

The cake and wine that followed was to them all a sacrament. They could not speak at first, Rose and Joe, but Dr. Pemberton began chatting cheerfully, and gradually they found their way through the wonder of it. Finally the old minister rose.

"I'm going to ask you to excuse me while I make a bit of a call. I'm going to your mother, Joe."

Joe started up, but his friend waved him back. "This is my business," he said. "I forbid you to come for an hour. You've got to make your peace with Rose first—or mine." And he was gone.

He went straight to the docror's. His old friend sprang up with an exclamation of alarm as he saw him. "Are you sick, man?" he asked.

The little minister looked up at him whimsically. "I've just married Joe and Rose," he said, "before they knew what was happening. Now I've got to tell Jane. You must come with me. If anything should hap-pen—"

The big doctor was upon him. "Ye've married Joe Campbell and Rose—married them! Man, it's the grandest thing I've ever heard! Ye've married them in spite of themselves! I wouldn't miss going with you for a thousand dollars! Ye've saved those children, Andrew man, and nothing else in the world would have done it. Eh, but I'm proud of ye!"

The big doctor still shaking with delight, the little minister grave and preoccupied, the two went down to Jane Campbell's. She was lying alone in the dreary, silent house, her knitting in her hands. She put it down as her guests entered. Suddenly she grew pale.

"You've come to tell me something!" she said.

Dr. Pemberton went up to the bed. "I've come to bring you good news, Jane," he said, his kind eyes looking straight into hers. "You've worn yourself out, poor child, beating down your own soul. You can stop now—you've got to. I married Joe and Rose this afternoon."

For a moment there was silence in the room, while the doctor watched keenly. Then Jane spoke.

"You'd better send some one in. I suppose it will have to be Amanda Gates. The wedding fruit cake's in the best room closet. I hate to have any one mussing round, but I suppose Amanda'll be the best."

As they reached his gate again, the doctor spoke.

"There's a woman for you! How many years d'ye suppose she's had that wedding cake ready? Won't ye bide awhile, Andrew, and talk it over?"

But the old minister shook his head.

"Not tonight, James," he said. "The children will be waiting up at the house."

He trudged off alone, facing the sunset, but the light in his eyes was that of one who had helped a soul out of bondage.

Flour and Breadmaking.

(Continued from last Issue.)

QUALITY OF THE DIFFERENT KINDS OF FLOUR.

It is impossible to bring out here all the differences in quality of the bread of the various kinds of flour. Fig. 1 shows the average size of the loaf of bread made from equal weights of the Western hard spring wheat flour and our soft Ontario winter wheat flour. The former is a good bread flour; it has more and better gluten, greater water absorptive power, greater expansion, and, in every resect but that of flavor, produces amore desirable loaf than the latter. Good bread can be and is being made every day from the soft wheat flour; but, while it may be preferred by some people, it will not make bread that will supply the demand of the bakers' customers so well as the stronger flour.

Fig. 2 shows loaves of bread from several of the grades of flour made from one stream of the Manitoba wheat, while the accompanying table gives the figures showing the percentage of gluten and the water absorption of the flours, the weight and size of the several loaves, and the quality of the bread. Exactly 12 oz. of flour was used in making each loaf. To secure figures showing the comparative quality of the bread, that made from the patent flour was taken as a standard and given 100 points for color, texture and appearance, and the other loaves were marked in percentage of the standard. The quality of the bread from the low grade and red dog was so poor that it could not be compared with that from the patent flour.

Flour	Per cent of wet Gluten	Per cent of water a'sorb'd	Weight of Loaf *Grams	Size of Loaf Cub. in.	Quality of Loaf		
					Color	Texture	Appearance
Patent	32.16	66.5	522	162.26	100.0	100.0	100.0
Bakers'	34.46	65.6	515	160.43	97.0	99.0	100.0
Straight Grade	34.09	65.9	517	160.43	96.0	99.0	100.0
Low Grade	41.13	72.4	530	145.18			
Red Dog	30.68	78.2	524	145.18			

*28.34 grams in 1 ounce.

The first three loaves are very similar in appearance, but, although the patent flour contained the less gluten, it was able to absorb the most water and give a slightly heavier and larger loaf of bread that was superior in color and texture to that obtained from the bakers' grade. The straight grade is, as might be expected, a fairly strong flour, but darker in color than the patent of bakers' grades. The low grade flour made a loaf of fair size, but in color and texture it was so poor that no strict comparison could really be made with the higher grades. The water absorption of the low grade flours, especially of the red dog, is very h gh and the weight of the loaf is correspondingly high. The patent flour made the largest loaf, and the red dog the smallest. The dark, branny flours are always high in absorption, but produce a very small, sodden loaf of bread which does not give much surface for evaporation of water, and is, consequently, very heavy and of poor quality.

It is evident that the first three flours are of good quality for mak- bread, while the fourth, grade, is poor in quality, although it contains fully as much food materials as that from the higher grades. The red dog flour may be used in making dog biscuits, or sold for cattle feed, but is seldom manufactured into bread.

In Fig. 3 we have a photograph of seven loaves of bread from seven different varieties of wheat grown on the Experimental plots of the Ontario Agricultural College. This cut illustrates the wide variation in the quality of the bread that the different varieties are capable of producing. The comparison is more fully brought out by a study of the figures given in the following table;

Fig. 1. Bread from straight grade flour made from, 1st, Manitoba wheat; and 2nd. Ontario Winter wheat.

Flour	Per cent of Gluten	Per cent of water a'sorb'd	Weight of loaf *Grams	Size of loaf Cub. in.	Quality of Loaf.		
					Color	Texture	Appearance
Bulgarian	26.87	47.4	458	128.71	97.0	97.0	100.0
Early Red Clawson	25.87	48.8	464	100.04	97.5	96.0	93.0
Kentucky Giant	27.10	48.8	460	120.78	99.0	101.0	95.0
Early Genesee Giant	26.87	48.8	459	132.37	100.0	100.0	100.0
Geneva	28.40	47.4	462	115.90	98.0	97.5	98.0
Dawson's Golden Chaff	22.50	48.8	473	111.63	90.0	94.0	96.0
Egyptian Amber	27.50	48.8	475	127.49	99.0	7.90	100.0

*28.34 grams in 1 ounce.

Egyptian Amber gave the best yield of bread, the Early Genesee Giant the largest loaf, and the best quality of bread, while Dawson's Golden Chaff and Early Red Clawson gave the smallest loaves and the poorest quality of bread. In Fig. 4 the cut loaves of Nos. 2 to 6, inclusive are shown. Note the coarse, open texture of Dawson's Golden Chaff and the Early Red Clawson, and the nicely rounded shape of the loaves from Early Genessee Giant and Geneva.

Previous mention was made of the fact that some localities produced a better quality of wheat than others. Fig. 5 shows the difference in size of two loaves of bread made from Ontario winter wheat grown in two different localities. The larger loaf was also much superior in color, texture and general appearance. It is evident that the millers in the locality in which the stronger wheat is grown or those who buy from this district, have an advantage over the unfortunate ones who have to use the weaker wheat.

Again, as is shown in Figs. 3 and 4, the gemeral quality of the wheat in any section will vary as the predominating varieties are of the stronger or weaker sorts. The miller grinds a mixture of varieties, usually striving to use enough of the stronger varieties with the weaker sorts to keep up a good quality of flour; but, unless he is catering to some special trade, he does not pay so much attention to uniformity of grade as when the stronger and usually more expensive flours are being made. In the case of the Western wheats, the same difference exists between varieties, localities in which it is grown, and the condition of the soil producing it, etc.; but most of this wheat is graded and passes through the elevators where all the wheat of the same grade is mixed together; consequently, unless the miller can buy from graded districts and ship by car directly to his own mill, he cannot control the selection of the wheat very much.

This mixing of varieties of wheat from different localities is blending to secure certain results; but, what is usually cheaper than the hard, and partially to secure the flavour of the one and the expansion and texture of the other. They are usually spoken of as "general purpose" flours, or as "household" flours.

Fig. 2. Bread from five grades of flour made from one stream of Manitoba wheat. No. 1, Patent; No. 2, Baker's grade; No. 3, Straight grade; No. 4, Low grade; No. 5, Red dog.

Fig. 3. Bread from seven Winter wheats grown on Experimental plots, Ontario Agricultural College.
No. 1, Bulgarian; No. 2, Early Red Clawson; No. 3, Kentucky Giant; No. 4, Early Genesee Giant; No. 5, Geneva; No. 6, Dawson's Golden Chaff; No. 7, Egyptian Amber.

Fig. 4. Cut-surface of loaves shown in Fig. 3.
No. 1, Early Red Clawson; No. 2, Kentucky Giant; No. 3, Early Genesee Giant; No. 4, Geneva; No. 5, Dawson's Golden Chaff.

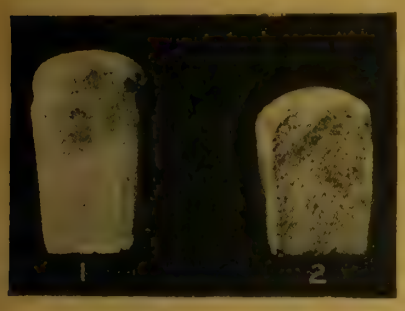

Fig. 5. Bread from Ontario Winter wheat grown in different localities.

In Fig. 6 we have an illustration of the effect of blending different proportions of the hard with the soft. Loaf No. 1 is made from an 85 per cent. Manitoba flour, and No. 7 is made from an 85 per cent. soft flour. No. 6. contains 20 per cent. of the Manitoba flour and 80 per cent. of the Ontario flour. No. 5 contains 30 per cent. of the Ontario flour, and Nos. cent. of the Ontario flour, and Nos. 4, 3 and 2 contain 40, 50 and 60 per cent., respectively, of the strong flour. Note the increase in size with the increased proportion of the stronger flour.

BLEACHING.

Every experienced baker knows that newly made flour does not give so satisfactory results in breadmaking as flour that has been aged by storing in a suitable place for two or three months. Why this should be so is not definitely known. There is probably a slight drying out of the flour which would naturally increase its water absorptive capacity. The expansive power is also increased and the flour is improved in colour. Bleaching the flour by chemical means appears to have a somewhat similar effect as that brought about by ageing; but, while a freshly milled bleached flour is better for breadmaking than the fresh unbleached article, the artificial bleaching will never make a flour equal in quality to that obtained under the ordinary conditions of ageing.

The results of bleaching are most plainly seen in the change of colour; the flour becomes whiter or bleached in appearance, but it has not the same desirable creamy shade that is obtained by natural ageing. However, because of the general preference for the whitest bread, a freshly made

Fig 6. Loaves of bread made from Manitoba and Ontario flous blended in following proportions:

No. 1	100	p.c.	of	Manitoba						
No. 2	60	"	"	"	and	40	p.c.	Ontario	soft	flour
No. 3	50	"	"	"	"	50	"	"	"	"
No. 4	40	"	"	"	"	60	"	"	"	"
No. 5	30	"	"	"	"	70	"	"	"	"
No. 6	20	"	"	"	"	80	"	"	"	"
No. 7					"	100	"	"	"	"

The following table gives figures showing the change in yield of bread, the size and quality of the loaf of bread produced in each case. Twelve ounces of flour was used in making each loaf.

Flour	Percent of Gluten	Percent of water a'sorb'd	Weight of loaf *Grams	Size of loaf Cub. in.	Quality of Loaf. Color	Texture	Appearance.
No. 1	34.09	68.8	523	167.0	100.0	100.0	100.0
No. 2	32.31	66.2	507	162.9	99.0	99.0	98.5
No. 3	31.86	64:6	495	146.4	98.0	98.5	96.0
No. 4	31.41	62.5	496	145.8	97.0	98.0	95.0
No. 5	28.97	61.4	489	125.7	96.0	96.0	92.0
No. 6	30.52	60.9	490	115.9	95.0	95.0	90.0
No. 7	29.63	52.3	477	111.6	94.0	94.0	87.0

*28.34 grams in 1 ounce.

A common blend used by the millers is 40 per cent. of the strong flour and 60 per cent. of the weaker Ontario flour. It will be seen that while the bread from this blend is not equal to that from the all strong flour, it is a good loaf in every respect.

bleached flour will usually sell for more money than the same flour unbleached. As a general rule only the better grades of flour are bleached. The cost of treatment is small and the action, while not instantaneous, is rapid.

B.

Guernsey's For Sale

1 yearling bull, and 4 between the ages of 4 and 10 months, all very fine animals.

WILLIAM COX & SON,
Canard, N. S.

Money Makers on the Farm

As I have so many enquiries about the care and management of turkeys, that to answer all and to give all the information required is so much of an undertaking and takes so much time I have gotten out a little book covering the whole subject, from the care and selection of breeding stock to the final chapter on fattening and marketing the birds. I am sure any one able to read can follow this and raise turkeys successfully. Complete details are given for getting up little coops for each brood costing no more than 25 cents each, and serviceable for many seasons. This book I will send for 23c to cover cost of printing and mailing. As I have only a limited number of this edition any one interested in raising 95 p.c. of all turkeys hatched should get a copy. Get this book and find out how turkeys may be reared as easily as chickens.

The Moulting Process.

(Continued from page 771.)

never be shown, or that are other than white in color, the use of iron as a tonic cannot be too strongly recommended. Plenty of green vegettables should be supplied if the fowls are not kept on grass, and a box of charcoal within reach is of service.

Many people give sulphur to birds during moult—a small quantity in the soft food. It is an ingredient in feathers and in eggs, and is good for fowls in mild weather, but should not be given on cold, wet days, owing to its tendency to predispose the birds to chill. Fanciers take far more trouble than we have described, some even go so far as to color-feed their birds. It is well known that many foods, if given during the moult, influence the color of the feathers, and exhibitors are not slow to avail of the knowledge. Some breeds vary in color at each moult; for instance, buff birds become paler each year, and Rocks sometimes get darker and sometimes lighter.

The time taken to moult varies with the age of the fowls. The younger the fowl, the earlier and quicker it moults and it is a safe rule that any farm bird that is not in moult in August will not lay an egg before Christmas. In the case of valuable stock birds a little more latitude may be allowed, as they are not wanted to lay before the following spring. Where there is no appearance of moulting when these lines appear, all the birds intended for laying next winter should be immediately put on a low diet, and by the middle of the month the moult should have begun. With the treatment above described, winter eggs should be fairly certain.—M., Farmers' Gazette.

The Good Bull Pays.

(Continued from page 767.)

blood; and one can better afford to pay $150 for such a sire than to accept another at $25 simply because he is "registered." Further, such a bull as a yearling ought to serve 10 cows outside of the herd at a fee of $2 each. Were the herd composed of 10 of his daughters as good as the heifer considered instead of the 10 it actually contained, the account would stand substbntially as follows:

Average gain from 10 cows, at $24.66 each	$246.60
Ten cows served at $2 each	20.00
Total	$266.60
Allow for cost of bull	150.00

Net profit for first years use $116.60

A well selected bull may be used for at least two years, and ought then to bring aconsiderable proportion of his first cost for breeding purposes elsewhere.

It is evident that such an investment pays, and pays well. It is a demonstration of the fact that, if an economical production of butter is desired, the improvement must come through the use of sires bred from cows of high-producing capacity, and that the best cows are raised on the farms—infrequently bought. It also shows the importance of sticking to the breed from which the improve ment began. Were the lesson generally heeded, three cows would produce as much as four ordinarily kept, saving both feed and labor.—C. Clarke in Kimball's Dairy Farm.

The Care of Cream for Buttermaking.

It is a recognized fact that the price received for butter is very largely influenced by its quality and this is in great measure determined by the care given the cream from which it is made. This matter is recognized by the Department of Agriculture at Ottawa as being of vital importance of the creamery patrons and and buttermakers of Canada; consequently there has been prepared by the Chief of the Dairy Division under the direction of the Dairy Commissioner, a bulletin on "The Care of Cream for Buttermaking." It commences with the health and feeding of the cows and follows the subject through the various stages of milk. ing, separating, storing and delivering the cream, each section being dealt with from the standpoint of the man on the job rather than of the official in an office.

The results of experiments conducted on farms and in creameries are given to show the advantages of separating a rich cream, properly cooling and storing it, as well as of making frequent deliveries. The bulletin says:—"Keeping the cream for longer than two days at the farms has, no doubt, much to do with the old cream flavor so common in gathered cream butter, and we can scarcely expect to have this defect remedied so long as cream is gathered less than three times each week."

The bulletin which is No. 32 of the Dairy and Cold Storage series concludes with a summary of important notes for patrons, creamery owners and buttermakers. Sufficient copies have been issued to supply each creamery with a copy for each patron. Requests for supplies for this purpose should be sent to the Dairy and Cold Storage Commissioner while individual copies may be received from Publications Branch of the Department of Agriculture at Ottawa. This bulletin is issued by authority of the Hon. Martin Burrell, Minister of Agriculture.

Potatoes for Cuba.

Two years ago enormous quantities of potatoes were shipped from New Brunswick to Cuba. Last year the shipments were very small because there was such an active demand in the Upper Provinces and the West. This year it is expected there will be a renewal of the trade with Cuba, and arrangements are being made by William Thomson & Co. by which there will be a steamship service between St. John and Cuba every fortnight if the demands of the trade should require it. It is anticipated that despite the prevalence of wet weather during July and the lateness of the spring season there will be a fair crop of potatoes in the province this year.

Electric Restorer for Men

MARKETS

St. John Prices.

GRAIN.—Wheat, $1.25 to $1.40 bush; Oats, 50c to 53c bush.; Peas, $2.40 to $2.50 bush.; Barley, 90c. to $1.00 bush; Buckwheat, 50c. to 60c. bush.

FEEDSTUFFS.—Bran, $25.00 ton; Shorts, $26.00 to $27.00 ton; Middlings, $27.00 to $28.00 ton; Linseed Meal, $6.00 per cwt.; Cottonseed Meal $2.00 per cwt.; Corn Meal, $1.80 cwt.

GRASS SEEDS.—Timothy, $9.00 to $10.00 bush.; Com. Red Clover, 25c. lb.; Mam. Red Clover, 27c. lb.; Alsike, 26c. lb.

LIVE STOCK.—Butchers Cattle, $2.80 to $6.90 cwt.; Stockers, $4.00 to $4.50 cwt.; Milch Cows, $55.00 to $70.00 each; Sheep, $4.00 to $4.25; Lambs, $5.00 to $5.50; Hogs, $7.00 to $7.50 cwt.

DRESSED MEATS.—Beef (carcass) 8½c. to 11c. lb.; Mutton, 10c. lb.; Veal, 9c. to 11c.; Pork, 9c. to 11c.

HORSES.—Drafters, $250.00 to $300.00

DAIRY PRODUCTS.-Creamery Butter, 26c. to 30c.; Dairy Butter, 22c. to 25c.; Cheese, 15c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 25c. to 28c. per doz.; Fowl, 12c. lb.; Chickens, 20c. to 25c. per lb.; Turkeys, 20c. to 22c. per lb.

FRUIT.—Apples, $2.00 to $2.50 bush Cranberries, 8c. to 9c.; Honey, 16c. to 20c. lb.

MISCELLANEOUS.—Hay, $16.00 to $18.00 ton; Straw, $6.00; Beef Hides, 10c. to 11½c. lb.; Calf Skins, 15c. lb.; Sheep Skins, 60c. to 80c.; Lamb Skins, 50c. to 60c.

VEGETABLES.—Carrots, $1.00 bbl; Potatoes, $2.00 bbl.; Turnips, $1.00; Beets, 30c. to 35c. doz.

Up to the present the produce market seems to be in favor of the producer. Prices in all lines have maintained a fairly high level, and owing to the unsettled weather during the growing season this condition is likely to continue.

The vegetable lines are easier owing to somewhat fresh deliveries. The market is fairly well supplied, but there is no indication of a slump as has been the case at this season of the year heretofore. This market is showing the increase in consumption due to the activity in building operations and public work now going on. This is not a temporary boom, but rather the beginning of a season of prosperity. Producers can have the market at a profitable basis right through the season by giving the consumer what is called for and of standard quality. Good stock always commands a price, while an inferior article is at the mercy of the market and the buyer dictates the price.

While the grain crop promises to be fairly good, hay is being harvested in bad condition. Good hay will be at a premium by the time the new crop comes on the market next year. The market is very strong on old stock and there is evidence of a serious shortage.

Garden truck of all kinds is going to be in demand. Reports received from localities where the line is a specia,ity would indicate about half a crop.

Owing to the low prices ruling last fall and winter for pork the raisers are not producing the usual quantity for fall delivery. As the consumption will be fully up to past years we are looking for high pork.

We expect country beef to be easy up to the new year. Shortage of feed will compel farmers to reduce their stock.

Dairy products are already showing signs of what may be expected when producers of milk have to house their cattle. It is our opinion that all the lines will be firm in price. The usual quantity of butter is not beng put in cold storage as the local demand is taking it as fast as the dairies can turn it out. A new high water mark in butter prices is in prospect.

A late fall may change the aspect but the growing season is so far advanced that a fairly correct estimate of the crop prospert can be arrived at, and, as we stated at the beginning, the market seems to be strongly in favor of the seller.

Apples are coming on the market two weeks later than usual and the New Brunswick crop is reported only fair.—Farmers' Produce and Dairy Co. Ltd.

Charlottetown Prices.

GRAIN.—Oats, 55c. to 65c.

FEEDSTUFFS.—Bran, $1.35 to $1.45; Shorts, $1.55 to $1.65; Middlings, $1.55 to $1.65; Oil-Cake, $2.35 to $2.50; Gluten Meal, $2.00 to $2.25; Corn Meal, $2.10 to $2. 25.

LIVE STOCK.—Butcher's Cattle, 4½c to 6c; Stockers, $18.00 to $35.00; Milch Cows, $30.00 to $60.00; Sheep, 3½c to 4½c; Lambs $3.00 to $5.00.

DRESSED MEATS.—Beef (carcass), 9c to 12c; Beef (retail), 8c to 16c; Mutton 8c to 14c.

HORSES.—Drafters, $125.00 to $200.00; Roadsters, $125.00 to $200.00; Carriage, $125.00 to $200.00.

DAIRY PRODUCTS.-Creamery Butter, Solid, 25½c, Prints 26c to 26½c; Dairy Butter, 20c to 24c; Cheese, List Board 12 15-16c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 23½c to 24c; Fowl, 80c to $1.25 pair; Chickens, 65c to $1.00

FRUIT.—Cherries, 10c quart; Raspberries, (retail) 10c quart; Currants, black 14c quart.

MISCELLANEOUS.—Hay $12.00 to $13.00 ton; Straw, $6.00 to $7.00 ton; Wool, 24c lb.; Beef Hides. 10c; Calf Skins, 12c to 16c; Lamb Skins, 20c to 25c; Sheep Skins, 25c to 35c. Potatoes, new, 50c bush.; Turnips, 25c to 30c bush.; Beets, 75c bush.

Market quiet, suppy limited, and demand good. Prices are about as quoted, but with new vegetables coming in and the supply increasing the price is dropping, and the prices we quote are the lowest we know of being paid.

Butter, cheese and eggs are all higher and market very firm. Beef is lower and in better supply. New grain is not ready yet but there will be some on the market within two weeks and prices will be lower in fact if any quantity was offered today, Oats would not likely sell at over 50c if at that, but the supply of old oats is about all cleaned up. New hay is not yet offered except in small lots of loose which is being used for local feeding.—R. E. Mutch.

The P. E. I. Cheese Board met in Charlottetown on Friday, Aug 16th with a fair attendance of salesmen. The buyers present were Messrs. Biffin, Spillett, Auld and Mutch. The President L. McDonald was in the chair. The cable message read: "2100 cheese offered on the Brockville Board, no sales. Market dull." The following factories boarded cheese; New Perth, 150; New Glasgow, 230; Stanley Bridge, 250; Kensington, 375; Cornwall, 80; Lakeville, 70; Red House, 60; Red Point, 65. All but New Glasgow sold to R. E. Spillett at 12 15-16. Mr. Mutch offered the same price for New Glasgow but was refused. Inspector Morrow was present at the Board meeting and thought that the directors of the different factories should meet with the cheese makers more frequently and look to the safety of the plant and give the cheese maker more assistance in looking after details, particularly in keeping cans clean.

Bad Blood

is the direct and inevitable result of irregular or constipated bowels and clogged-up kidneys and skin. The undigested food and other waste matter which is allowed to accumulate poisons the blood and the whole system. Dr. Morse's Indian Root Pills act directly on the bowels, regulating them—on the kidneys, giving them ease and strength to properly filter the blood—and on the skin, opening up the pores. For pure blood and good health take

GOOD RELIABLE GUNS

at Wholesale Prices. Send for free 200 page Catalogue of Guns, Rifles, and Sporting Goods.

T. W. BOYD & SON, 27 Notre Dame St. West. MONTREAL.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application, and you will get quick relief. For sale by all dealers.

Handling Sheep at Shearing Time.

A writer in a letter to the Agricultural Press says in regard to the handling of sheep at shearing time:—

"Before shearing commences proper provision should be made for the fleeces to be kept as free as possible from all bits of rubbish, straws and other objectionable substances. As a general rule it is not an easy matter to keep out extraneous matter, the nature of the sheep and its native habit both being against the accomplishment of their object. The chief obstacles which prevents wool being sent to market perfectly clean is that the substances which are not wanted in it find their way there quite unobserved, and more than ordinary vigilance is required to prevent them from becoming mixed with the wool. The dark color of the outside of the fleeces renders them partly invisible and the shearing, folding and packing helps to bury the stuff more deeply among the fibres. The scouring process brings much of the rubbish to view, in consequence of the whiter appearance of the wool after it has gone through the bowls. The disintegration of the material also makes it possible to feel the tiny pieces of wood, bits of leaves, etc., which having found their way on to the sheep's back before much progress has been made in the growth, has become embedded in the centre of the staple and cannot be seen until the fibres are thoroughly separated by the fingers. We have often thought that nothing would be so beneficial and interesting to wool growers as to see the actual processes through which their products are put. They would then be able to form an idea of the important though somewhat outside position they occupy in the great wool industry. After seeing for themselves how their fleeces are handled, they would be able to realize that their work is on no mean order.

HOW TO HANDLE THE SHEEP.

The floor of the building in which the sheep are shorn must be thoroughly swept, and then large doors laid on the ground. These will be much better to work on than either the bare floor or the sheep stocks which are frequently used. The latter implement is very useful in its place, and often serves a good purpose at shearing time, but the ewes should certainly not be laid upon it to be relieved of their fleeces. When it is used the sheep require to be lifted on to it, which takes longer and is not so easily done as simply turning them on the ground. They are also less comfortable, and consequently more likely to cause trouble to the shearer. One half of the art of shearing lies in knowing how to handle the sheep, and the other half being able to manipulate the shears. Many a man could shear all right if the sheep volunteered to behave themselves. Unfortunately they do not always do so, though this is generally the fault of the workman. So long as the animal is kept in a comfortable position there will be little trouble, and if any slight movement is taken as a sign that the sheep is not being held as it should be, and a change of position made, the shearer will find that he can continue his work almost with out interruption. Fatal injury may be done to the interna organs of the sheep by rough usuage and when shearers have been employed who have not cared how they did their work, the number of the flock has been seriously reduced. If the animal should succeed in twisting itself into an unnatural position, it should be allowed to rise to its feet rather than be forcibly made to return to a more natural attitude. The shearer's attempt to compel his victim to assume the posture he requires only intensifies the creature's determination to do otherwise, and if neither party will give in a twisted bowel may be the result. If the fleeces are taken off with the sheep on the floor in the way described, all casualities may be avoided. The ewes can be turned about into almost any easy position, and the operation completed in the minimum of time with the least possible amount of extertion.

Dustman's Book of Plans

—AND—

BUILDING CONSTRUCTION

By U. M. DUSTMAN
(Licensed Architect

10,000 Sold in 30 days

Price, $2.00 Prepaid.

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an anthority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs Writing of Specifications.

This book will be sent, together with a year's subscription to The Maritime Farmer, to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscripton If you are not already a subscriber and want the book, you may obtain it and The Maritime Farmer for $2.00. These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER,

SUSSEX, - N. B.

Halifax Provincial Exhibition.

In three weeks the Sixteenth Annual Exhibition of Nova Scotia will open to the public.

Judging from the entries so far received in live stock classes the show will be greater than ever.

The management is sparing no expense to make the amusement end of the fair the best that has ever been given the public.

In addition to the usual good horse racing for which this fair has been notable in the past, three afternoons of foot racing will be held, open to all amateurs in the Maritime Provinces.

The most attractive and high-class acts of vaudeville have been engaged headed by Cedora on the Golden Globe, and for the first time in the province; daily Aeroplane flights will be given, the aviator starting from the centre of the track enclosure and returning to same place.

This is not an airship, but one of the most up-to-date aeroplanes of the Curtis type.

The fair will be opened on Wednesday, Sept. 11th, by the Right Hon. R. L. Borden, Premier of Canada.

Entries in all classes close on Saturday, August 24th.

THERE IS NOTHING FOR THE LIVER SO GOOD AS MILBURN'S LAXA-LIVER PILLS

They will regulate the flow of bile to act properly on the bowels, and will tone, renovate, and purify the liver, removing every result of liver trouble from the temporary, but disagreeable, bilious headache to the severest forms of liver complaint.

Mrs. John R. Barton, Mill Cove, N.B., writes:—"I suffered, more than tongue can tell, from liver troubles. I tried several kinds of medicine, but got no relief until I got Milburn's Laxa-Liver Pills. They are a wonderful remedy."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MAXWELL'S HIGH SPEED CHAMPION

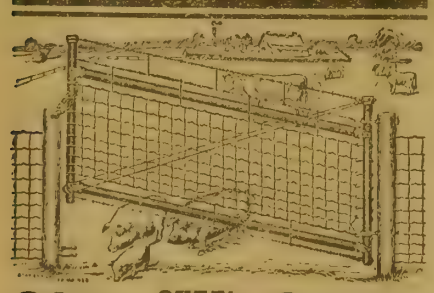
The Wringer Board extends from the side, out of the way of the cover. This allows practically the whole top of the tub to open up—makes it easy to put in and take out clothes.

No other washer has as large an opening. No other washer can be worked with crank handle at side as well as top lever.

Do you use Maxwell's "Favorite"—the churn that makes quality butter?

Write us for catalogues if your dealer does not handle them. 89

DAVID MAXWELL & SONS, ST. MARY'S, Ont.



Clay STEEL FARM Gates

CAN BE EASILY ADJUSTED TO LET SMALL STOCK THROUGH (see illustration.)

They are the most convenient and serviceable farm gates made. Positively keep back breachy bulls. They cannot bend, sag, break, blow down or rot, and are fully guaranteed.

2000 Clay Gates sold last year. Write for our 60 days free trial offer—also our illustrated price list.

Canadian Gate Co., Ltd.
54 Morris St., Guelph, Ont.

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

Directions for Sending Specimens.

Orchardists are urged to examine their trees and plantations very closely for injurious insects and fungous diseases.

Specimens of insects, if dead, should be wrapped in paper or cotton and inclosed in a strong pasteboard, tin or wooden box. If the specimen is particularly soft, it should be packed in cotton saturated in alcohol Wherever possible caterpillars and so forth should be packed alive in a box together with a supply of their food; air-holes are not necessary. Particulars as to where the insect was found and the nature of damage which it is doing, whether to leaves, buds or stem, are frequently of great importance.

In the case of bacterial or fungous diseases, choose specimens representing every stage of the disease. Moist material or material likely to decay, should be packed as dry as possible. Press small plants or parts of larger ones carefully between layers of newspapers, protecting this if necessary, with stiff cardboard. Fruits, each separately wrapped, should be packed in strong cardboard boxes.

All such packages should contain the name and address of the sender, and are carried postage free.

Send specimens of insects to: Dr. C. Gordon Hewitt, Dominion Entomologist, Central Experimental Farm, Ottawa.

An Insect Enemy of the Potato Bug.

Editor the Maritime Farmerj—

Readers of "The Farmer's Advocate" have seen in the issue of the 18th. July, that Mr. Peter McArthur has found a beetle preying on the potato bug.

My son found one a few days ago, which when touched walked off with a young potato bug on its proboscis. This one varied in color from the one found by Mr. McArthur, but apparently belongs to the same family. It was light brown, about as broad, but rather shorter than the adult potato bug, but had the square shoulders noted in the one previously mentioned.

Mr. McArthur says "It is rather a handsome creature, of about the same length and breadth as the hard shelled potato bug, square-shouldered and attractively marked with yellow stripes on the back ground." I noticed it had its proboscis sticking into a young potato bug.

The important point is that in each case the beetle had its proboscis sticking into a young potato bug and walked off with it when touched, which leaves no doubt that it had a firm grip on the bug.

Now we want to know how to spare this beetle while keeping the bugs in check, until it becomes plentiful enough to keep them under control for us.—J Turner, Sackville, N. S.

A Herd With a Record.

Samuel Dickie & Sons, Central Onslow, N. S., writes:—The bulls we offer for sale in our present advertisement in the Maritime Farmer, are a real high-class lot and in good growing condition. Their dams average 12,358 pounds milk in one year. Seven of the bulls are sired by Helbon DeKols Prince, whose dam has a record of 17,346 pounds milk and 710.50 pounds butter in one year at the age of three years and four months. Among the lot are a couple of exceptionally good ones, fit for service, from cows with records of from 15,000 to 18,000 pounds milk in one year. There is also a very fine calf, about six months old, whose two nearest dams average 25.55 pounds butter in seven days in official test, average per cent. butter fat 4.15.

Among recent sales was a fine young bull to Mr. Joseph R. Taylor, Upper Dorchester, N. B. This bull was sired by Helbon DeKols Prince, and is out of a young cow that averaged over sixty pounds milk per day for three months after calving. Her yearly record going over 8,800 pounds in one year, when but twenty-two months old.

Another sale was a nice heifer calf to E. H. Barter, St. Stephen, N. B. This heifer was also sired by Helbon DeKols Prince and her dam is Cobequid Arne Belle, the reserve junior champion at the 1910 Dominion Exhibition, St. John. Until the last few days of hot weather our entire herd of cows have averaged about 36 to 37 pounds milk per day with only two cows and a heifer that freshened since January.

FREE TO MEN

You Yourself Can Restore Your Vitality

VITALITY is the greatest power in the world. If I renew your VITAL VIGOR I restore you to full and complete manhood. No matter what your age, whether you are young or elderly, no matter what early indiscretion may have sapped your courage. If I resupply you with new VITALITY I give you the strength that all healthy, vigorous men possess. I know the source of this VITAL SUPPLY. My HEALTH BELT, with suspensory attachment, pours a great stream of VITALITY into your system hour after hour all night while you sleep. Thousands have said it immediately benefits and takes the pain and weakness out of the back from one night's use. No drugs, no medicines, no restrictions of any sort excepting that all dissipation must cease. The man who indulges an excesses and unnatural practices can never be other than a weakling, but if you promise me as man to man that you will be decent, take ordinary care of your health and then use my HEATH BELT every night for 60 to 90 days, I should then be able to do in your case exactly what all these other thousands of men have said I did for them. Please write for my booklet to-day. Never mind about purchasing a Health Belt now; first get into communication with me, read what my book says, then later, if we decide between us that you should have a Belt and if you decide that you want to use it, I will arrange for you to have one to wear until you are cured. My Health Belt is the greatest vitalizer the world has ever known. With special attachments it is a remedy for kidney, liver, stomach, bladder disorders, rheumatism. etc.

Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man. young or old, who would be strong in manly vigour. It is a word of hope, a carefully written, interesting booklet which should be in every one's possession. Therefore, send to-day. If in or near the city, call at my office. Hours 9 to 6

DR. M. F. SANDEN CO., 140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free.

"Were all medicines as meritorious as Chamberlain's Cholic, Cholera and Diarrhoea Remedy the world would be much better off and the pescentage of suffering greatly decreased," writes Lindsay Scott of Temple, Ind. For sale by all dealers.

To Prevent After Swarms.

If we cut all the cells but one on the fifth or sixth day after the issuing of the swarm, as has been recommended many times, we are not sure that the cell left will hatch; and furthermore, the bees still have larvae young enough to convert into queens, which they are almost sure to do, and in this case they will often kill the queen which hatches first instead of allowing her to destroy these later-started cells, when we not only have as many after-swarms as we should have had had we not cut the cells, but we have also the disadvantage of having queens reared from old larvae, which all concede gives inferior queens.

If we wait about this cutting of cells until the eighth day we shall run no risk of the colony swarming; where the first swarm was not kept back by foul weather there will be no larvae young enough to convert into queens. As a rule, the first young queen will be hatched, and all the queen cells there are in the hive. For these reasons, wait till the morning of the eighth day after a prime swarm has issued; before opening the hive, take out the first frame cells. If none are found shake most of the bees off near the entrance of the hive, into which they immediately run, when the frame is closely inspected for queen-cells, peering into every nook and corner for them; for, should some small, crooked one be missed, swarming would surely result.

All cells are cut off after a frame has been shaken to rid it of bees, for this shaking of the young queens in their cells is likely to cause them to be deformed, if not killed outright. The next frame is treated in the same way, unless ripe cells are found, in which case it is set outside of the hive awaiting the finding of a cell from which the queen has hatched, when all are cut off. Should none have hatched, then the best one of the ripe cells on the frame set out is saved and put back into the hive.

In this way we can make sure that no after-swarm will issue from this hive, and it is the only certain plan. Of course, any manipulation of a colony of bees must be done at the proper time and in the proper manner to secure the desired results, which means that the successful bee-keeper is one who has his eyes wide open all the time and sees and appreciates what is going on in his apiary from day to day, and, from what he sees, and from what he reads, is prepared to take advantage of circumstances.

Where one wishes to do away with swarming entirely he must either divide his bees or work for extracted honey. Most persons having outprefer the latter plan. The idea is to supply empty combs and to take away the full ones. If they are thus kept busy it will surpress the swarming tendency.

Oiling Harness.

Neatsfoot oil is made from the feet and joints of cattle. These are boiled to extract the oil. Only the best grade of oil should be purchased for harness, even though it is more expensive than the poorer grades. There is nothing better for harness than neatsfoot oil.

Before oiling harness it should be first taken apart and soaked in warm water to soften the surface accumulations, and then it is cleaned with castile soap and a brush. When the harness is practically dry, but not stiff, the warm oil is applied heavily enough fully to permeate the leather. After it has had time to sink in, any surplus should be wiped off.

Bale Your Hay and Sell It

THERE is always a ready market at a good price for baled hay. It occupies only about one-fifth the space of loose hay. It can be handled easily. It prevents waste and it retains its full food value. Many farmers are making hay the big cash crop of their farms, not only because of the high profits it brings at the present market value, but because as a rotation crop it renews the richness of the soil. These farmers make all the profit themselves. They get a price for baled hay which far more than covers the cost of baling. They are able to ship it to the markets where the price is highest. A big majority of these farmers

Use IHC Hay Presses

the only presses on the market today which fill the need of the individual farmer. Like all other I H C machine lines, our hay press line is complete. You can get I H C pull power presses requiring either one or two horses; I H C motor presses using 3, 4, or 6-horse I H C engine. Both styles have three separate bale chamber sizes, 14 x 18 inches, 16 x 18 inches and 17 x 22 inches.

The I H C pull power press has a greater capacity than any other horse press of its size. It is also easier on the horses; the stepover is the lowest and narrowest made and the horses are pulling no load when they cross it. The I H C hay press has an adjustable bale tension which insures compact bales. It is fitted with a roller tucker that turns in all straggling ends, so that the bale is neat and smooth in appearance. The bale chamber is so low that the attendant can tie the bale without walking round the machine.

The I H C motor press consists of a bale chamber and an I H C engine, mounted together on substantial trucks. It is easily moved from place to place, can be backed to the stack or barn and is always ready for work. The engine does not need a man to watch it. Give it a supply of fuel and water and see that it gets plenty of oil and it needs no other attention. There is no danger of fire because there are no flying sparks, nor is there any smoke or soot to interfere with the comfort and efficiency of the workers. The engine is detachable. Two extra wheels, an axle, and a belt pulley are furnished, so that when not baling hay you have a regular portable I H C engine, which can be used the year around to run a small thresher, saw wood, pump water, generate electric light, grind feed, or separate cream or to run any farm machine for which it supplies sufficient power. Two perfect machines in one. Now is the time to get ready for your haying. Make it a big money crop. Call on the I H C local agent in your town or write the nearest branch house for an I H C hay press catalogue.

I H C Service Bureau

The purpose of this Bureau is to furnish, free of charge to all, the best information obtainable on better farming. If you have any worthy questions concerning soils, crops, land drainage, irrigation, fertilizer, etc., make your inquiries specific and send them to I H C Service Bureau, Harvester Building, Chicago, U S A

A root cellar like this won a prize last year.

THE drawing was made from a photograph of the root-cellar with which D. A. Purdy, of Lumsden, Sask., won a cash prize in last year's contest. In that last contest there were 36 prizes. There will be ***three times as many prizes*** (108) in the

1912 FARMERS' PRIZE CONTEST

THUS you will have three times as many chances of winning a cash prize. You do not have to use any certain amount of Canada Cement to win a prize. There are absolutely no "strings" to this offer.

There are twelve prizes for each Province (three of $50; three of $25; three of $15; and three of $10) and you compete only with other farmers in your own Province and not with those all over Canada.

It makes no difference whether you have ever used cement. Many of last year's winners had not used it until they entered the contest. When you write for full particulars, we will send you, *free*, a book, ***"What the Farmer Can Do With Concrete,"*** which tells everything you need to know about concrete. It is absolutely free, and you are under no obligation to buy "Canada" Cement or to do anything else for us.

WRITE your name and address on the coupon, and mail it, or use letter or post card, and we will send you at once the book and full particulars of the 1912 Prize Contest.

British Dominion Butter.

The following paragraphs are taken from W. Weddel & Co., Ltd., "Eighteenth Annual Review of the Imported Dairy Produce Trade for the year ended June 30, 1912," issed today:—

"The imports of butter from the British oversea dominions for the past year unfortunately again illustrate the uncertainty of supplies which necessarily attaches to enormous areas, like Australia, New Zealand and Canada, with their varied climates. The year which closed twelve months ago provided us from the British dominions with the heaviest import on record, viz., 61,023 tons, while in the twelve months just ended only 52,857 tons arrived. This check in the import is very disappointing, notwithstanding the similar experiences in the past. The successive and enormous increases in the two preceding years of 14,440 and 14,386 tons, respectively, encouraged hopes of still further progress, and the sudden decline of 8,166 tons must be regarded as a very great misfortune.

On the other hand it should not be overlooked that notwithstanding this decline, one-fourth of the butter imported into this country in the past year came from our kith and kin beyond the seas. A survey extending backwards for ten years shows the imports of British oversea butter to have more than doubled.

CANADA DROPPING OUT.

If the three sources from which this butter comes be examined, there is, however, another cause for regret in the fact that Canada, the nearest of the dominions to this country, is evidently dropping out of the trade. Ten years ago over 13,000 tons of Canadian butter came to this country, while twelve months ago the import had fallen to 776 tons. It is true this amount grew to nearly 3,000 in the past year; but the increase was due more to the excessively high prices ruling in the Untited Kingdom last autumn than to there being any real surplus of butter in Canada available for export. Canadians were tempted by the high prices to overship, but soon discovered that they had not enough left at home to supply their own requirements, and in past winter had to import Australian and New Zealand butter in very large quantities, at higher prices than those obtained for their own exports.

"For some time past every year has supplied sufficient evidence to prove that so far as butter is concerned, Canada is nearing the end of her export business. During last autumn, when she sent us 3,000 tons, it was principally to the ports of the Bristol channel and to Liverpool. On the London market, for the year ended with June, Canadian butter was not once in sufficient supply to secure an official quotation. In recent years Canadian butter has been imported into this country mainly for cold storing to supply our winter requirements. In the future these requirements will have to be filled from Australian and New Zealand by fresh landed goods. This will be an advantage to the Home trade as well as to the Commonwealth and the dominion of New Zealand, for however well butter may keep in cold store, it is not so palatable as when it is freshly made, and there is likely to be an increasing demand for the better article.

"An examination into the falling off in the imports of British dominion butter from other parts of the empire for the past year, reveals the fact that this misfortune is due solely to the droughts in Australia, which brought about reductions in the export from Queensland, New South Wales, Victoria and South Australia, amounting altogether to 10,718 tons. The increases of 2,221 tons from Canada and 331 tons from New Zealand reduced the net decrease to 8,166 tons."

BRITISH DOMINION CHEESE.

"It is greatly to be regretted that the British dominion imports of cheese are not following the same lines as the British dominion imports of butter, which in the past ten years have more than doubled. The real cause of the decline in imported British dominion cheese is somewhat paradoxical, for it is due to the progress and prosperity of one of these dominions, viz., Canada. That country is increasing in population so rapidly that it cannot keep up the supply of cheese to its home population and at the same time continue its exports to the United Kingdom. This development in Canada is bring prosperity to the dominion of New Zealand, which is preparing to take over the business which Canada year by year is less able to carry on.

"In the past ten years Canadian imports have fallen off by 15,000 tons. while New Zealand imports have increased to the extent of 22,000 tons. The statements made in Canada by those who know the cheese trade there, that Canada will cease to export by the year 1916, though of an alarmist character, may have some foundation, in view of the enormous rate of increase in her population, mostly by immigration. New Zealand, therefore, will be acting prudently in preparing for probable developments in Canada. By erecting dual plants for butter and cheese she will be in the best position to meet all reasonable emergencies. Canada lies so close to the over-populated countries of Europe, and the means of access to her boundless areas of fertile soil are so cheap, that the stream of immigration will most probably steadily increase in volume and the declining years of her export trade come much earlier than now seems probable."

LITTLE ROOM FOR IMPROVEMEET IN QUALITY.

"For the last few years Canadian cheese has been so free from damage in transit that there can be very little room for further improvement in this direction. It is only the manufacture that offers opportunities for any further progress towards perfection, and the past year has not shown any wide field for criticism of a suggestive character on this point. Canadian shippers are every year more and more alive to the necessity of placing their cheese on our markets before the bulk of the New Zealand article arrives, which is in January. This will gradually do away with some of the expense of long storage in Canada, and at the same time prevent deterioration in quality in the stores there, and so give better satisfaction when it arrives in this country."—J. E. Ray, Trade Commissioner, Birmingham, Eng.

Are You Coming to the St. John Exhibition?

While there, do not fail to call at the MOLASSINE MEAL tent, which will near the entrance. We are sure you will be interested. Let us show you some Animals that we are positive will win prizes, that were fed on MOLASSINE MEAL. This is your chance to be convinced, if you are one of the few who are not already.

MOLASSINE MEAL, the great HORSE, CATTLE, PIG and POULTRY Feed, is made in England.

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

The Maritime Farmer

and Co-operative Dairyman

Has Again Selected SUSSEX, N. B., as Its Home.

BELIEVING that we would be able to handle our growing business in a larger centre we moved The Maritime Farmer from Sussex to St. John, N.B., in October, 1911.

While business has been exceptionally good and advertisers and readers have alike expressed their appreciation of the worth of The Maritime Farmer, we who have had a "peep behind the scenes" felt that in order to keep properly in touch with farming conditions we must get "back to the land."

The building which we occupied in St. John was sold and as we were forced to seek new quarters we decided to bring The Maritime Farmer back to Sussex, its old home and birthplace.

Sussex is the centre of one of the finest farming districts in Canada, where the farmers are enthusiasts and where science and practical experience go hand in hand.

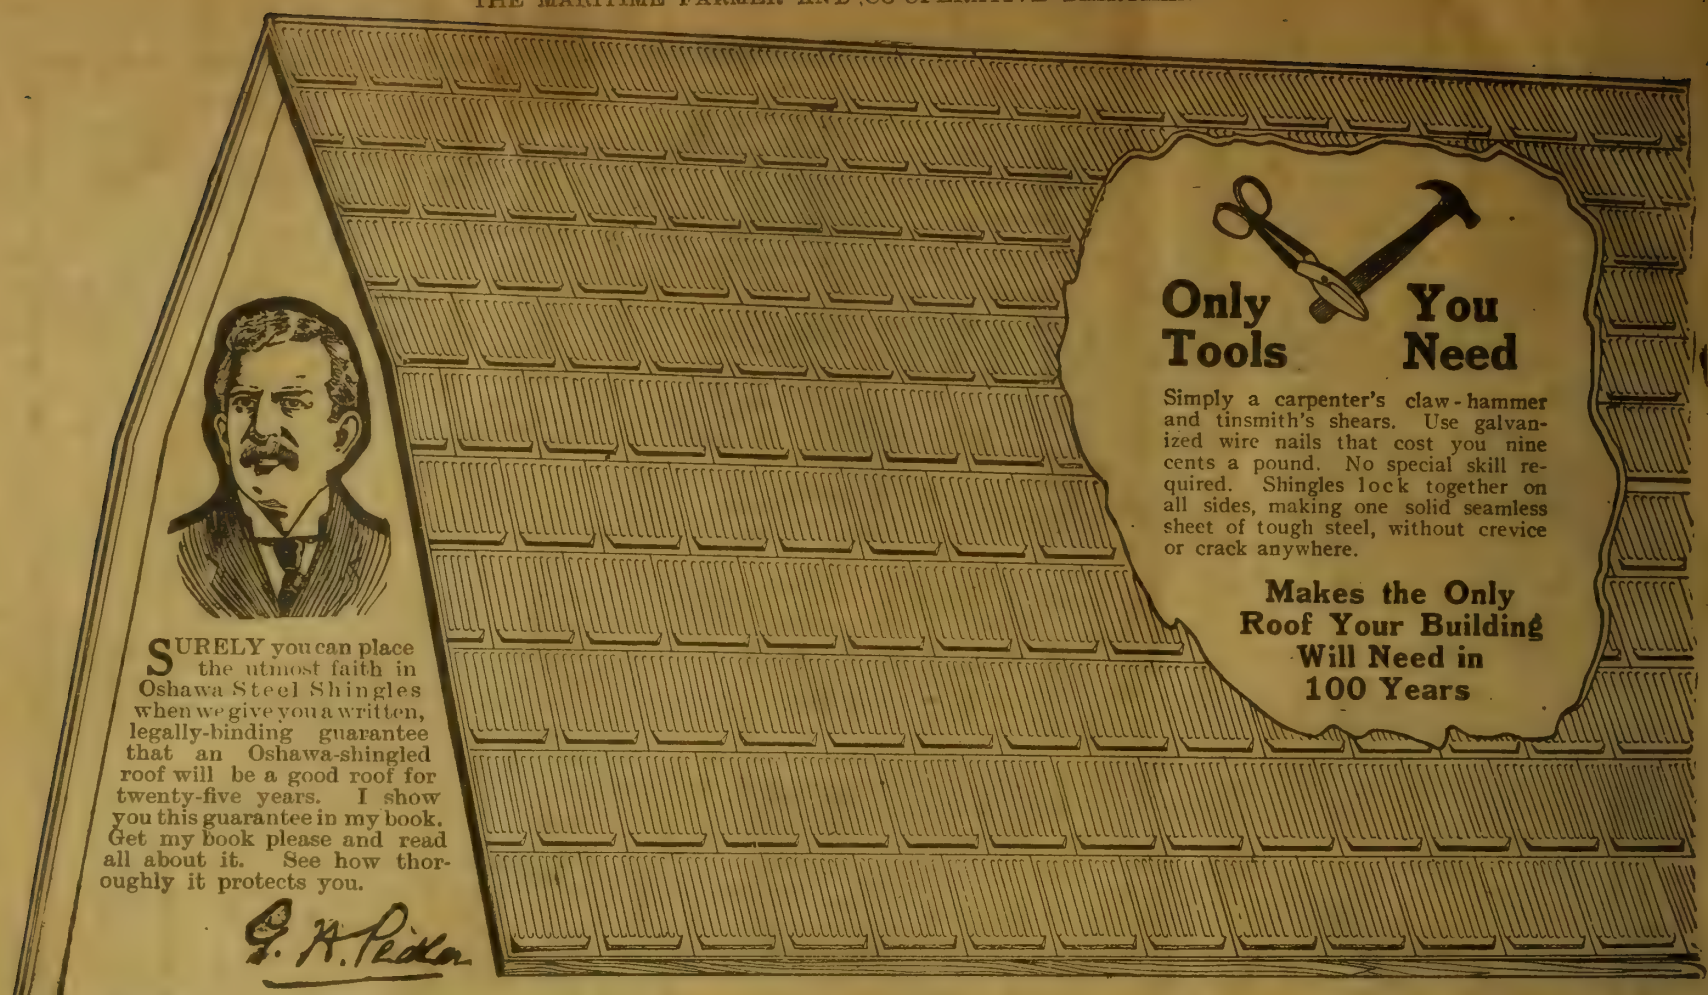
The Maritime Farmer is now comfortably situated in one of the finest printing offices in Eastern Canada, the building having been especially designed for a "print shop," being the home of the Kings County Record.

One of the greatest drawbacks we have had to contend with in the past was the lack of a press large enough to handle The Maritime Farmer in quick time so that we could hold our forms open until the very latest moment for the accommodation of advertisers and to give the latest market reports. This difficulty has been overcome as our printers have installed a No. 12 Babcock Optimus flat bed press, with one exception the largest in Canada. We are now able to print sixteen pages of The Farmer at one time instead of eight pages as formerly.

The move, we believe, will prove advantageous both to readers and advertisers as we are enabled to carry on our work with higher efficiency and to assume newer and heavier responsibilities.

We extend a cordial invitation to all our friends, old and new, to call and see us in our new home.

R.D. ROBINSON PUBLISHERS, Ltd., Sussex, N.B.



SURELY you can place the utmost faith in Oshawa Steel Shingles when we give you a written, legally-binding guarantee that an Oshawa-shingled roof will be a good roof for twenty-five years. I show you this guarantee in my book. Get my book please and read all about it. See how thoroughly it protects you.

E. A. Pedlar

Only Tools You Need

Simply a carpenter's claw-hammer and tinsmith's shears. Use galvanized wire nails that cost you nine cents a pound. No special skill required. Shingles lock together on all sides, making one solid seamless sheet of tough steel, without crevice or crack anywhere.

Makes the Only Roof Your Building Will Need in 100 Years

Here's the ONLY Right Roof for You

I REFER to my Oshawa Steel Shingles. Reckon it all up and see if you don't agree with me. A roof that is one big seamless sheet of 28 gauge steel, smoothly and thickly galvanized by the Pedlar process of rust-proofing. A roof that cannot rust, will not gather moisture on underside, stay a good roof for a hundred years at a cost of less than five cents a year. A roof that makes your building safe against both fire and lightning. A roof that makes your building warmer in winter, cooler in summer. A roof that costs no more than common wood shingles to **put** on, and much less to **keep** on. A roof that needs no painting, no patching, no tinkering or repairs for at least twenty-five years—or you get a new roof free. The **only** roof that is guaranteed in writing. Certainly a roof like this is the only right roof for you. You cannot be sure of as much down-right roof value from any other kind of roof you can buy. The question is: Can you afford to risk your money in any other kind of roof.

The ONLY Roof that is Guaranteed in Writing

I claim a good deal for an Oshawa-shingled roof. Almost too much to be true, some folks think. So do makers of other roofs. But note this difference. I give you a **written guarantee** that's good for a new roof any time within twenty-five years if any Oshawa-shingled roof fails to make good everything I promise. That means that its cost when you put it on is the **only cost** for the next twenty-five years. Will the "other fellow" give you such a guarantee? I don't know any one who will. They want **you** to take the risk. They talk very confidently—and promise, yes indeed. But can you get their promises down in writing and signed—like mine are. That's the only way you can be positively sure of a roof that will be

Good for 25 years or an Entirely New Roof Free

My guarantee, remember, is a **written** one, in proper legal form, and is backed by 50 years of honorable dealing, and over $365,000 of invested capital, the biggest business of its kind in the British Empire. It is your roof-insurance for twenty-five years. When you consider that no other roofing is guaranteed at all, even though you pay as much for it as you pay for my Oshawa Steel Shingles, there's no doubt about which roof you should buy.

PEDLARIZE All Your Buildings--Inside and Out

BY "Pedlarizing" I mean doing for the whole building what Oshawa Steel Shingles do for the roof. I make other kinds of sheet metal building materials—for ceilings, side walls, outside—that make your whole building more fire-proof, more sanitary, more beautiful, more substantial. You should know about them. May I send you a booklet and pictures that tell the whole story? It's free. Just ask me to tell you about "Pedlarizing."

First Cost no More than Roofs You Think Cheap

Of course you don't want to pay any more than you have to for a good roof. But for the amount you **have to** pay you ought to get the roof that will cost the least to **keep** on. And Oshawa Steel Shingles make the **only** roof you can **be sure** will end your roof expense once you get it on. My written guarantee settles that. Figure it out any way you like. You'll find an Oshawa-shingled roof as cheap to begin with, and far cheaper in the long run, than **any other** roof you can buy.

Best Protection against Both Fire and Lightning

This fact alone is reason enough for putting my Oshawa Shingles on the next building you roof. Lightning causes over 40% of all fire-damage on farms. Destroys about 7,000 farm buildings each year on this continent. In one year killed 623 human beings and 4,500 head of cattle—most of them housed in wood-shingled buildings. My Oshawa Steel Shingles would save all this terrible loss. Because they make a lightning-proof roof. They are better protection than any number of lightning rods—better than the best and cheapest lightning insurance policy. Best fire-protection, too. The saving in fire-insurance premiums alone pays the whole cost of an Oshawa-shingled roof in a very little while. Your insurance agent will tell you.

Send for My Free Book "Roofing Right"

Then you'll have **all** the facts about this weather-proof, rust-proof, rot-proof, fire-proof, lightning-proof roof, which needs no painting or patching for the biggest part of your lifetime. By reading my book you may save yourself considerable money and a lot of bother. It is free. Do write for it—right away.

Write to Address Nearest You. **Ask for "Roofing Right" Booklet No. 17**

Published Twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada.

Vol. 17. SUSSEX, N. B., SEPTEMBER 10, 1912 No. 23

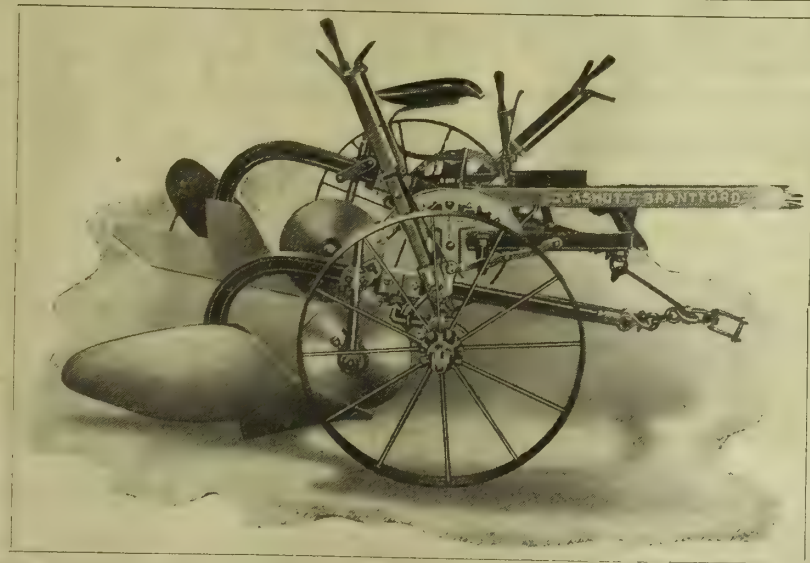
HERE is the Ideal Plow for Hilly, Irregular Farms. Do You Need It? . . .

THE Cockshutt Two-Way Plow is the most satisfactory Sulky Plow for Hillside and irregular land plowing. It is also used successfully for plowing level land, so with it you can do ALL your plowing if your farm comprises both kinds of ground.

For irregular shaped fields, or those cut up by creeks, etc. it is the only plow to use. When such a field is plowed with our Two-Way the work is done satisfactorily. You won't see any irregular centres or crooked furrows after the Two-Way.

On Hillside plowing you will find the Two-Way will do excellent work. When one bottom is working the other is out of the way. See also the position, of the wheels. They are so placed that the plow will not tip over when at work, a feature of great value. The furrows are turned all one way and left in a uniform land.

The Cockshutt Two-Way is designed and built to give the best service. Every part from the beam to the mouldboard is constructed of the best materials that can be bought for the purpose. Note carefully the construction of the Pulley Shift Clevis. When one plow is raised and the other lowered, the Clevis shifts automatically. There is no side draft on the Two-Way because the pull is direct from the Beam point.



The tongue on the Cockshutt Two-Way can be shifted by means of the short lever near the seat, so the plow will take more or less land as the operator wishes. The bottoms can be raised by pressing a lug into the ratchet on wheel hubs. Then the team does the lifting. We put our celebrated No. 21 bottoms, cutting 10 to 12 inches wide and 4 to 8 inches deep on this plow. It will certainly do your work satisfactorily.

Cockshutt Plows

The famous Cockshutt line of Riding and Walking Plows is sold exclusively by Frost & Wood Agents. These plows include a wide variety of single furrow and gang plows for every soil condition. Cockshutt plows are built in what is generally conceded to be the best plow factory in Canada and by men who have made the plow business their life-study. Our agent in your vicinity will be glad to show you this extensive line and explain to you the many superior points it possesses over all others. This extensive line, together with our excellent Frost & Wood plows, gives you a better assortment to choose from than you can get anywhere else—a fact which we know you will appreciate when buying your next plow. Our catalogue describing our complete line of Haying, Harvesting, Seeding and Cultivating implements is at your disposal. Let us send you one to-day.

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

This farmer saved $290 by using *Certain-teed* Roofing

Quality Certified Durability Guaranteed

on his barn—and so can you

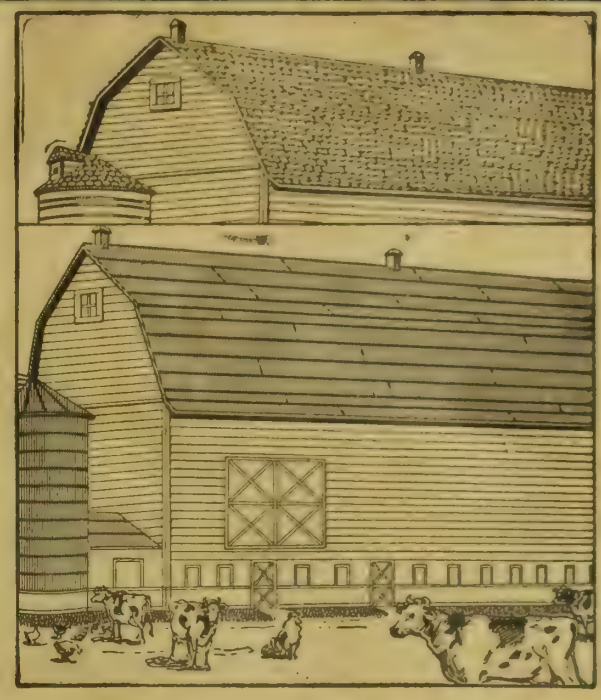
General Roofing, U. S. A.'s Largest Manufacturer of Roofings and Building Papers.

This barn covered with *Wood* Shingles would have cost

$495

This barn covered with *Certain-teed* Roofing cost

$205



The best material in Roofing does not mean the most expensive

THE farmer today simply can not afford to cover a large barn or building with metal—or even shingles—on account of the *high cost.*

The successful, prosperous farmer today is the man who looks at both sides of the dollar and if he can save $290 or more on a roof—getting a better and more durable roof covering—he is ahead just that much. Benjamin Franklin says: "A penny saved is a penny earned." The rich save money—that's the reason they *are* rich. This is why the big railroads, as well as factories, are now using large quantities of ready roofing.

Tested for years on the roof—guaranteed waterproof and weatherproof

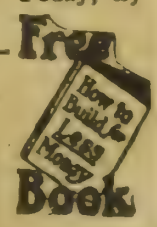
Look around you—have you noticed the increased number of farm buildings that are being covered with ready roofing? Your lumber dealer may prefer to sell you wood shingles, he usually has a big stock to get rid of—or your hardware dealer may coax you to try the old-fashioned, short-lived metal roofing—but don't make any mistake, *Certain-teed* Roofing is wonderfully durable, and best of all, *costs less money.* It comes in Rolls or Shingles and is easily applied. You can get it from your local dealer in Rubber finish, Sand surface or Mica coating.

Certain-teed Roofing contains no tar, no paper, just the best quality felt and asphalt. No need worrying about how long the roofing will last if you buy *Certain-teed* Roofing—the roofing that bears the guarantee direct from the manufacturer. Look for the *Certain-teed* Label and the picture of the General on every roll—it is for your protection—don't accept any substitutes.

You cannot buy *Certain-teed* Roofing from any mail order house. *Certain-teed* Roofing is guaranteed for fifteen years—give your local dealer the preference—you would rather buy from him and he can save you money. Today, try

Certain-teed Roofing—Free

easy to apply--put on in strips, lapped or rubber shingles



Certain-teed Roofing is sold throughout the provinces of Canada by local dealers and is distributed by wholesale jobbers in St. John, Halifax, Quebec, Montreal, Ottawa, Toronto, London, Winnipeg, Calgary, Saskatoon. Edmonton, Regina, Moose Jaw, Brandon, Vancouver, Victoria. Send the coupon today for our free book—B-U-3—"HOW TO BUILD FOR LESS MONEY."

COUPON

Without obligation on my part please send me your book BU3 "How to Build for LESS Money," and I will read it. This book is to be sent to me postpaid and absolutely free.

DE LAVAL
CREAM SEPARATORS

Are In a Class by Themselves

They cost but a little more than the cheapest, while they save twice as much and last five times as long as other separators.

They save their cost every six months over gravity setting systems and every year over other separators, while they may be bought for cash or on such liberal terms that they will actually pay for themselves.

Every assertion thus briefly made is subject to demonstrative proof to your own satisfaction by the nearest DE LAVAL local agent, or by your writing to the Company direct.

Why then in the name of simple common sense, should anyone who has use for a Cream Separator go without one, buy other than a DE LAVAL, or continue the use of an inferior separator?

Maritime Wire Fence Stands the Strain

of unexpected accidents, without a flinch. It holds under the most trying conditions. Maritime Wire Fence makes good because Maritime material is first quality, and Maritime workmen excel in their calling.

All Maritime Fence is made from extra heavy smooth No. 9 wire, so thoroughly galvanized that it won't peel. The Maritime lock holds the joints so rigidly that they can't give or pull out of shape. Maritime Fence is rust-proof, accident-proof, and as near wear-proof as man can make it.

Maritime Fence is your kind of fence—made as you would make it yourself—if you could. Maritime Fence is true economy for you. It is made and sold upon honor. Costs no more than inferior fence. Send now for our free fence booklet. Tells you everything you want to know about fences. Write while you are thinking of it. It will pay you,—pay you well.

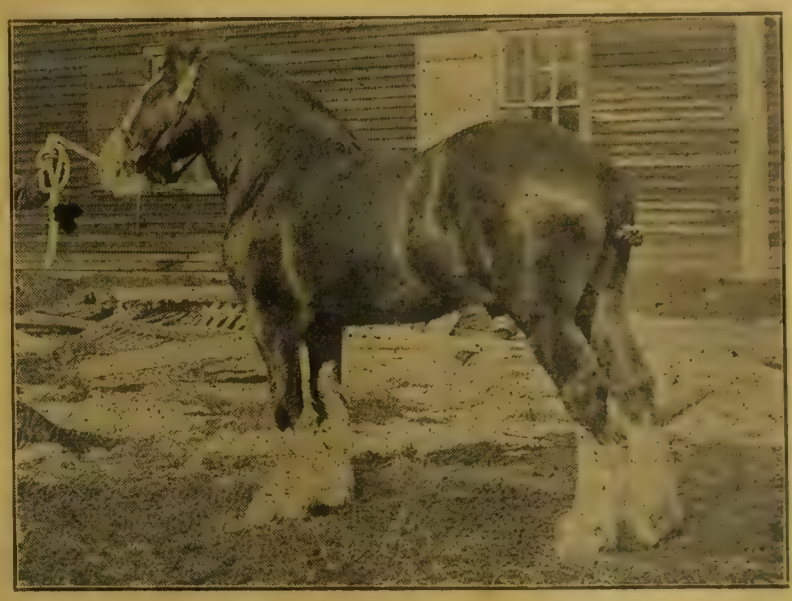
The Greater Saint John Exhibition.

Fair Weather and Record Attendance.

AFTER a serious of optimistic addresses by men prominent in the St John Exhibition Association, the city life of St. John and in the agricultural resources of New Brunswick, His Hon. Lieutenant Governor Wood touched the button on Saturday evening, August 31st., that formally then opened to the general public the gates of the Greater St. John Exhibition, the first show in the Maritime Circuit of 1912 fall fairs. The addresses by the various speakers bristled with words of cheer, re the future prospects of New Brunswick, prospects which are being hourly becoming brighter as the Greater St. John looms up, with a pace in keeping with the developments of her winter port and the train of special advantages that will surely follow.



Baron Squire.

Champion Clydesdale Stallion at the 1912 St. John Exhibition. Owned and exhibited by McFarlane Bros., Fox Harbor, Cumberland Co., N. S.

THE LIEUTENANT GOVERNORS' ADDRESSES

Lieutenant Governor Wood when called upon to formerly open the exhibition referred to the fact that it was the first occasion on which he had been asked to perform such a duty and continued as follows :

"This exhibition by the Exhibition Association of St. John city and county, has become one of the established institutions of the province. It began its corporate existence in 1889 and after meeting and overcoming many difficulties in its career of upwards of twenty years, I am glad to know is at present in a most prosperous condition. The last year was one of the most successful in its history.

"The time appointed for holding the exhibition this year is too early to enable the farmers to display the fruit, grain and root crops of the present season's growth. The exhibits which will be made, will however, show the capability of this province of producing crops of this character of a high standard of quality.

"The spring has been a backward one and the unusually wet weather has interferred with the harvesting of the hay crop. This crop is an important one and promises to be an unusually good one but owing to the wet weather at the time of harvest, considerable loss will be entailed. The same cause will no doubt injure the potato and root crops, especially where the land is low or poorly drained. The pastures have been very good, stock is in good condition and dairy interests should have a successful year. I understand that the number of entries for this portion of the exhibition will be about the average.

"The general condition of the farming population should be satisfactory. It has greatly improved within the last few years. Though in numbers our farming population have not increased, nor the acreage under cultivation, yet better methods have been adopted, new and improved machinery has been employed, the land has been better cultivated, and very much better results obtained. In the last few years there has been a very material advance in the price of ali kinds of agricultural produce, the farmer has found little difficulity in marketing his crops. The demand has been active, the prices high and the payment cash. As a class, I believe the farmers have made greater progress and accumulated wealth more rapidly than any other class in the province.

"There has been marked progress in the development of the natural resources of the province. The discovery of natural gas in the county of Albert promises to contribute very greatly to the general prosperity. Its utility in furnishing light, heat and power at a low cost has been demonstrated. The present indications justify the belief that it exists in such quantities as will attract to this province a number of the larger manufacturing industries. The discovery of iron at Bathurst and development of the mines will greatly benefit the northern part of the province. The active working of the Grand Lake coal fields on a large scale will benefit the central portion of the province. The construction of the St.John Valley Railway and the extension of the Central Railway to connect with the C. P. R. at Fredericton, will be of great benefit to the whole province. The large expenditure to which the Dominion government is committed at Courtenay Bay, and the works already undertaken by the C. P. R. on the west side of the St. John harbor will afford greatly increased accommodation for shipping and the export and import trade of the province, which has shown a satisfactory increase in the past, will greatly increase and St. John will take its rank as one of the chief commercial seaports of the Dominion.

"The census taken by the Dominion government during the last year shows but very small increase in the population of the province. In the older settled portions, with the exception of the cities, there has been no increase, and in some sections the population has actually decreased. It is not, however, fair to measure the prosperity of the country by the increase of its population. Its prosperity depends not so much upon numbers, as upon the industry and progressive spirit of its people. During the last few years there has been an entire revolution in the conditions under which we live. Better implements and labor-saving appliances have come into general use among the agricultural and laboring classes and improved machinery has been introduced in connection with all manufacturing industries. One man under present conditions can produce more than ever before. The farmer, the mechanic and the laboring man are better rewarded for their labor, and if industrious and frugal, contribute more to the wealth of the community in which they live than they could do under the conditions which exhisted in former years.

"Although our province has not increased in population, its people were never more prosperous than now. This exhibition will demonstrate this fact. Besides proving an illustration of the prosperous condition of the country, its mission will not be entirely fulfilled unless it is educational. It should show to those who visit it, who have done well, that they are not perfect, that others are doing better, and by adopting other methods they may do better. Exhibitions of this character bring our people together in such a way that each sees the improvements and profits by the ideas of all the others. No one should leave this exhibition without acquiring

some knowledge that will prove useful to him hereafter.'

He then declared the exhibition formally opened.

The addresses by the other speakers who preceded the Lieutenant Governor, were brim full of pictures of the future greatness of St. John and several allusions were made to the developments that are there now taking place.

THE MANAGEMENT.

H. A. Porter, the efficient manager of the fair, was always on hand to make matters run as smoothly as possible. The success of the 1912 fair proves that he is a good man at the helm.

THE WEATHER AND ATTENDANCE

The weather was all that could be desired and the merry click of the turnstiles recorded a record attendance of sight seers.

THE AMUSEMENTS.

were clean and the various arts were cleverly performed. No one went away disappointed for each and every part of the show was up to the standard with the exhibition association announced.

IN THE MAIN BUILDING.

A conspicuous feature of the 1912 exhibition was the absence of cheap displays. In almost every case the designing and decorations were of a high degree of excellence. The several buildings, themselves, showed a marked transformation. The installation of the new system of tungsten lighting and the profusion of flags, festooning and bunting produced a most pleasing effect.

All the booths were very tastily arranged and each and every one of them contained displays of interest to the visitors. There was no booth in the main building, however, which seemingly drew so much attention and on which so much interest centered as did the "Made in St. John" display exhibited under the auspices of the Board of Trade.

FIELD ROOTS, GRAINS AND GARDEN VEGETABLES.

Owing to the peculiarities of the past season the display of field roots, grains and garden vegetables was rather slim. R. Robertson, Superintendent of the Nappan Experimental Farm placed the awards. A full list of the prize winners will be found on another page of this issue.

FRUITS.

There was a good display of preserved fruits, in jams, jellies, and preserves that had a particularly appetizing appearance. The display of apples was not up to the mark, in either point of quality or of quantity. Many specimens were shown in a very immature state, owing to the earliness of the season. The whole apple exhibit was very much inferior to the grand display that visitors to St. John saw at the 1910-11 fall fruit show, when New Brunswick fruit at its best gave the visitor an insight into New Brunswick's apple growing possibilities.

Visitors, to the 1912 fair, who are familiar with New Brunswick and Nova Scotia climatic conditions, and fruit growing possibilities could picture the wealth of color and quality that the fruit display would evidence were the various specimens allowed to remain on the trees until their respective picking seasons had arrived.

A. G. Turney, Provincial Horticulturist placed the awards.

THE APIARY DEPARTMENT.

Mr. E. L. Colpitts, who judged the apiary section was well pleased with the quality of the products therein displayed. The weather conditions experienced during the past season were not favorable for honey production. Mr. W. G. Aspbell, of Sussex, had a very attractive assortment in this section, the quality of the various products in his collection was very good and carried off a great many of the red tickets. R. L. Todd and others also made interesting displays.

BUTTER AND CHEESE.

Mr. Harvey Mitchell, of the Dairy Division, Ottawa, placed the awards in the butter and cheese sections. The cheese was of good quality throughout but the butter, in many cases, would have stood a little more care in the various details of the buttermaking in order to bring out a better quality.

The butter making competition was under the direction of Mr. L. C. Dayle, dairy Superintendent.

Near the Dairy Department, Mr. Flewelling, of the Dairy Division, had an interesting display which emphasized the importance of cow testing and the care of milk and cream from the time the milk is drawn until it is put on the table for use, either in its natural state or as a finished product.

THE LIVE STOCK DEPARTMENTS.

Notwithstanding the amusements and other attractions in the various departments of the fair, on no part of the show was so much interest centered as on the live stock departments. There were few, if any, visitors who did not take a keen interest in the showing made in the horse cattle, sheep, swine and poultry classes. In these sections the farmers saw ideals of type towards which they may gradually attain by systematic feeding, breeding and weeding.

Horses

Light horses were judged by Dr. J. A. Sinclair, of Cannington, Ontario. He did his work without fear or favor and in cases where there was no competition, unless the animal shown possessed quality enough to warrant the awarding of a prize, or any prize, he had no hesitancy in dealing out such awards as he considered justifiable and applicable to the case. Some of the punishments dealt out were not very highly appreciated by some of the horseman, but the general effect will be an uplifting of the ideal standard.

R. S. Starr, Port William, N. S., a successful breeder and exhibitor of Clydesdale horses, judged the heavy horse classes. Mr. Starr has judged horses at the Toronto and other exhibitions where his decisions have given general satisfaction.

THOROUGHBREDS

were few in number. Two aged stallions, three mares, over three years, and a brood mare with foal by her side made up the total number of entries in the class. Samuel Jones, St. John, had the champion stallion while H. R. McMonagle, Sussex, had the champion female, Lindahorna which he sold during the fair for a handsome figure. Waterlight, the champion stallion at the Maritime Horse show went down to defeat before the Jones horse on the question of breed type.

STANDARD BREDS

were also few in number. In the aged stallion class, W. J. Alexander's Dan Gilbert, carried off the red ribbon. Maritime Prince, a winner of sixteen first prizes and six second prizes at various Maritime shows and second in a field of eleven horses at Halifax, in 1911 was put out of the money because his age had been obliterated on his registry certificate. The best thinking horsemen who know Maritime Prince and his past record as well as his present good form were very much chagrined over this decision, and were not a bit slow in expressing their disappointment. A two year old stallion, a one year stallion, and a mare, H. R. McMonagle's Inheritus, by Montrose King, by Nelson's Wilkes, out of a Sir Charles dam made up the remainder of the Standard Bred classes.

HACKNEYS.

Aged hackney stallions were three in number. R. A. Snowball's Model Performer topped the list and carried off the Sweepslates diploma and Silver medal, donated by the Canadian Hackney Horse Society for the best stallion on the line. John Jackson's Stampede came in for second money and McFarlane Bros' Sedgeforth Enterprise stood in third place. There was only one other Hackney stallion on the grounds, a two-year-old, shown by Randolph Cox.

R. A. Snowball's Langton Lily carried off the diploma for best mare, any age, and the silver medal donated by the Canadian Hackney Horse Society for best mare, on the line.

FRENCH COACHERS.

Were represented by W. J. Alexander's Onyx, in the aged stallion class and Onyx Jr. in the one year old section.

CLYDESDALES.

The Clydesdale classes were by far the best classes of the horse department. The aged stallion section had eight entries. McFarlane Bros.' Baron Squire and Vanderbilt capturing the first and third monies while R. A. Snowball's Baron Balgreddon was sandwiched in between them in second place. H. C. Jewett's Sorbie Boy came in for fourth place and was followed in fifth position by the Fraser Lumber Companys' Baron Corning. Baron Squire captured the diploma and gold medal for best Clyde stallion, any age, a close competition for this honor being G. C. Cossar's two-year-old stallion, Dunbar Crag.

The aged mare section brought out seven good ones. R. A. Snowball's May Lothian and her mate Marinetta capturing first and second monies, W. W. Black's Miss McKay captured the third award and fourth and fifth honors, had there been such would have gone to the Fraser Lumber Company's Lady Rose and Rosaline. Winsome Bessie, owned by John B. Barton was one of the good ones in this class.

In the two-year-old filly class, R. A. Snowball had everything his own way with two very typical fillies. R. A. Snowball also captured the one-year-old filly first prize red ribbon. The Fraser Lumber Company captured the blue ribbon and John Price had the winner of the third prize, a Royal Baron's Pride filly, which was sold during the fair to G. C. Cossar.

John A. Hughes' Lady Ann Carleton and her foal by Baron Admiral captured the red ribbon in the brood mare, with foal by her side and foal of 1912 sections.

R. A. Snowbail's May Lothian captured the diploma and gold medal for best mare, any age.

Snowball's Baron Balgreddon and Moss Rose captured respectively the monies offered by the Clydesdale Association of Canada for the best Canadian bred stallion and mare.

SHIRES.

Samuel Jones and Edwin Hogan each showed one-year-old Shire stallion. Mr. Hogan also showed a pair of one-year-old fillies in the Shire class.

PERCHERONS.

In the aged Percheron Stallion section there were six entries. H. C. Jewett's Gresham led the way, W. H. Fowler's Mathurin followed in second place and Jamieson & Walkers' Glenеur captured the third money. E. A. Chamberlain had the only entry in the two-year-old stallion class and Ernest Floyd had no competition against his one-year-old stallion.

Chas Symes'Distinguee was the only aged mare in the ring. Symes' also had the only filly in the one-year-old class. Geo. F. Mayes had the only two-year-old filly in the ring. Chamberlain had no competition against his brood mare and her foal of 1912.

Jewett's Gresham captured the championship diploma for the best stallion, any age.

HEAVY DRAUGHTERS

were a good class. The aged mare or gelding section had seven entries. The two choicest plums in the list went to the Fraser Lumber Company, much to the delight of their popular and efficient horseman, Mr. Jas. Armstrong. W. W. Black captured the remainder of the money in this section. In the matched team section of this class there were only two entries. A Fraser team headed the money list and a W. W. Black team took second award.

MEDIUM DRAUGHTERS.

W. W. Black's horse captured the red ribbon in the single section of this class heading a list of eight entries. John B. Barton, had the second best and Thos. A. Barrett snatched the third prize ribbon.

In the matched section E. Hogan, W. W. Black and P. H. Nugent respectively captured first, second and third monies.

ROADSTERS.

In the Roadster stallion class, H. J. McManus' Maritime Prince, the rejected in the Standard Bred class, captured the most coveted prize from his apponent Dan Gilbert.

The prizes in the aged mare section of the roadster class were won by W. J. McIntyre, P. H. Nugent and John Gillis.

A Buz Fuz filly, shown by Orin Hayes topped the two-year-old colt or filly section followed in second and third places by W. J. Alexander and B. E. DeBow. Walter Kirkpatrick had the only matched pair in the roadster class.

CARRIAGE HORSES.

In the carriage horse class the first and second monies on single and first on doubles went to Geo. McAvity. A H. Merritt captured the third money in the single class.

HEAVY HARNESS HORSES.

In the heavy harness carriage horse class awards were made on the basis of sixty per cent. for the horses and forty per cent. for the equipment. In the single horse section of this class Mrs. Arthur H. Merritt captured the first prize ribbon, P. H. Nugent following in second place. Geo. McAvity's tandem had no competition and was awarded first money.

SADDLE HORSES.

The saddle horses made a good showing and prizes were awarded as indicated on another page of this issue.

GENERAL PURPOSES HORSES

as a class were disappointing.

COMMERCIAL HORSES.

G. B. Taylor had the only horse in the light delivery section of the commercial class. In the heavy delivery section the Dominion Express Company captured first, second and third monies.

COBS AND PONIES.

In this class, S. Bishop had the only entry in the section for pony under 12½ hands. There were three entries in the section for ponies 12½ to 14 hands. J. P. Clayton showed the only jenny on the grounds.

Beef Cattle

Shorthorns, Herefords and Devons and grades of the two former mentioned breeds made up the beef cattle display at the fair. R. W. Wade, Guelph, Ontario, placed the awards to the satisfaction of all interested breeders.

SHORTHORNS.

With the exception of two bulls shown by the Fraser Lumber Company, C. A. Archibald and R. A. Snowball had all the Shorthorns at the fair. Both herds were out in fine fettle, and honors were fairly even. Archibald's Prince Ideal captured the red ribbon in a class of three aged bulls, and finally secured the male championship diploma. Snowball captured the first prize on breeder's young herd. The aged herd prize went to C. A. Archibald. The female championship was captured by Edith 4th. a senior yearling heifer owned by R. A. Snowball.

HEREFORDS.

W. W. Black had the only herd of Herefords at the fair and as usual he had the various animals in the herd out in good shape. He had lots of quality and could stand any amount of competition.

DEVONS.

There was only one herd of Devons of which the less that is said the better, as they were out in such poor fit that they were no credit to the show nor to the breed, but an eyesore among so much good stock in the stables.

BEEF GRADES AND FAT CATTLE.

Hereford and Shorthorn grades and fat cattle were shown by W. W. Black and C. A. Archibald.

Dairy Cattle

F. R. Mallory, Frankford, Ontario placed the award in the Ayrshire, Holstein, Jersey and Grade Dairy classes. Matters ran smoothly in the Holstein and Jersey classes but not so with the Ayrshire men as the majority of the interested breeders were not at all satisfied with the placings in two or three of the sections, which strengthened their contention that a class of such magnitude as the Ayrshires were at St. John should be entitled to be judged by a thoroughly competent Ayrshire expert. While they all admitted that the judge did conscientious work so far as he knew, the fact that he is a Holstein breeder loomed up before those who did not concur and in could not follow his placing of awards in the two or three classes already mentioned. Ayrshires were represented by the cream of the principal Maritime Province herds. McIntyre Bros., were out stronger than ever with a splendid lot of well groomed, thrifty looking cattle. Prescott Blanchard and Retson Bros. were there with their best and there are some good specimens included in the number. M. H. Parlee, another show ring veteran had his stock out in good form. S. Creighton & Son were also on hand with a very creditable lot as was J. A. Hughes with a few entries. The most coveted awards went to McIntyre Bros., Spring Brook Farm, herd. Their Grange Kelly, first prize aged bull in a class of top notchers also captured the male championship and diploma with three of his get. Their Morton Mains Lady Nelly, first in the four-year-old cow class of ten, captured the female championship and diploma with two of her offspring.

The Senior and Breeder's young herds red ribbons were also captured by the Spring Brook herd. In the four animals, get of one sire, class, Grange Kelly's calves led the way followed in second by another McIntyre Bros.' quartet, sired by their old stock bull, White Hall Sunrise, recently sold to R. R. Ness and champion last week at Toronto. The first award of two animals, the progeny of one cow was captured by Easton Bros. with McIntyre Bros. in second and third places. Easton Bros. also had the red ribbon winners in the senior yearling bull, two year old heifer and junior yearling heifer classes as well as a number of other prizes in second and third places. Creighton had the only two-year-old bull, a good one, and a close competition for championship honors. The red ribbon winners in the dry cow three-year-old and two-year-old cow classes were also owned by S Creighton & Son. Parlee had the best senior bull and junior heifer calves. Retson Bros. led the way in a field of ten aged Canadian bred cows. A full list of awards in this class will be found on another page. With one or two exceptions, there was strong competition in every section of the class.

GUERNSEYS.

There were two good herds of Guernseys in the ring, and they were satisfactorily judged by Supt. R. Robertson of Nappan, N. S. Howard W. Corning was over from Yarmouth County with a particularly uniform, milky looking lot and in competition with the largest herd of the breed on Prince Edward Island very successfully managed to carry off a goodly number of first, second and third prizes as well as championship diploma for best bull, any age, with Island Prince of Hillside, also the head of the list with bull and three of his get. The female champion was Dolly of the Villet, one of the Island herd. The diploma for cow and two of her offspring went to Fanny of Willow, another one of the good ones in the Island herd. Both herds were out in condition to win. The Island herd captured the first honor in the aged herd classes while the similar honor of the breeder's young herd went to the Yarmouth herd.

JERSEYS.

were represented by three good herds. H. S. Pipes & Son were over from Nova Scotia and a battle royal for honors was waged between their herd Josselyn & Young and S. Creighton & Sons' herds. The first prize for aged bull went to Creighton's Brampton Phra, who also captured the male championship in a stiff competition. His competitors in the aged bull class were Foxhall St. John o' Dreamwold and Imported Fereor, winners of second and third places respectively.

In the two-year-old bull class, Josselyn & Young's Pogis of Lakewood downed Pipes' Bloods Own. In the senior yearling bull class a Pipes bull, Brigadier, won the red from Josselyn & Young's Foxhall Keene. Pipes & Sons also led the way in the bull calf sections with Distinction in the senior section and Romance in the junior section.

Josselyn & Young's Flying Fox's Adora, Pedio's Gladys, Pipes & Sons' Babbit, and Creighton's Golden Beauty stood in first, second, third and fourth positions when the judge had completed his inspection of the aged cow class. Flying Fox's Adora also won the championship diploma. The best cow and three of her offspring class was headed by Josselyn & Young's Pedio's Judy shown in the Canadian bred class. Pipes' Imported Fereor was first with three of his get. Josselyn & Young captured the most coveted herd prize in the senior herd section and a similar honor on junior herds went to H. S. Pipes & Son. The prizes in the other section of the Jersey class were pretty evenly divided between Pipes' and Josselyn & Youngs' herds. Creighton & Son also managed to get a respectable look in at the money in sections where they had entries.

HOLSTEINS.

were exhibited by J. D. Irving Lea & Clark, Harding Bros. and John A. Hughes. The respective breeders had their herds out in a very creditable condition and as usual the black and whites were much admired. Irving's two-year-old bull, Lord Sea View Rooker, captured the male championship and his aged bull, Togo of Seaside came in for reserve honors. The two-year-old Irving cow, Dorindo Vale, captured the female Sweepstakes and another Irving cow, Rosa Bonheur Beauty, shown in the aged class was reserve champion. Irving also captured the red ribbon on both aged and breeder's young herds. Harding Bros.' Sir Mercena Forforit Lad was first with three of his get. Sir Mercena Forforit Lad's three animals, the get of one bull, also stood at the top of the list.

Lea & Clark's Jacoba Johanna could not be put down with two of her offspring. Her offspring also held the red in spite of strong competition.

The competition in the respective Holstein classes was very keen. The Irving and Harding herds comprise a magnificent lot of home bred and imported individuals. Mr. Hughes is only a beginner and will be heard from later. The Lea& Clark herd is composed almost entirely of home bred stock. There is not an animal in their herd with the exception of their stock bull under four years old that they did not breed themselves, and these compare very favorably with the imported individuals of similar ages. See full list of awards on another page.

DAIRY GRADES.

The dairy grades were without a single exception a credit to their owners. The only competitors being Lea & Clark with a magnificent lot of Holstein grades and McIntyre Bros. with an equally desirable lot of Ayrshire grades, the majority of which would give pure breds of their respective breeds a run for their money if they were judged in the same classes. They were a milky looking aggregation of which any farmer might justly feel proud and an ideal which showed what may be accomplished by persistently breeding along one specific line.

Sheep

were judged by Mr. R. W. Wade and they were a good, uniform, well-fitted lot.

LINCOLNS

were shown by Albert Boswall, Chas Symes and Almon D. Boswall. Albert Boswall's aged Lincoln ram captured the sweepstakes bronze medal, donated by the Canadian Bank of Commerce for the grand champion ram, any breed, two shears and over.

OXFORD DOWNS.

J. E. Baker & Sons' Oxfords met foes worthy of their steel in Burder Goodwin's splendid aggregation, the latter capturing all but two of the first prizes. The Bakers had the best shearling ram and ewe as well as very close seconds in the other classes.

SHROPSHtRES.

were represented by two good Prince Edward Island flocks shown by Geo. L. Boswall and Cephas Nunn. Nunn had the best shearling ram and ewe. Boswall led in the other sections of the class.

SOUTHDOWNS.

Cephas Nunn and J. E. Baker & Sons had everything their own way in the Southdown class. Nunn captured all the red ribbons in the class with the single exception of the first prize on aged ewes which went to the Baker flock.

DORSETS

were shown by Geo. L. Boswall and Cephas Nunn. Boswall captured the major part of the prizes taking first in every section but one.

HAMPSHIRES.

Cephas Nunn found no opposition against his Hampshires. He was out with quality that would stand good, stiff competition.

... SUFFOLKS.

Albert Boswall showed a nice flock of Suffolks but had no competition.

CHEVIOTS.

Chas. Symes and Geo. A. Symes were over from Nova Scotia with two very choice flocks of Cheviots and honors were pretty evenly divided.

LEICESTERS.

Albert Boswall, S. L. Boswall and Retson Bros. waged a three cornered contest in the Leicester class. Albert Boswall captured the lion's share of the prize money. Retson Bros followed in second place and S. L. Boswall took the remainder.

Swine

were also judged by R. W. Wade and exceeded in both numbers and quality the showing made at the Dominion two years ago. Yorkshires, Chester Whites, Poland Chinas and Duroe Jerseys made up the classes The various porkers were all in good shape. Sows with litters predominated in point of numbers. Prizes were awarded as will be found on another page of this issue.

Poultry

The poultry exhibit was not up to the standard of former years in quality nor in numbers. No doubt the cutting down of the prize list kept outside exhibitors of poultry away. All who are interested in Poultry Husbandry regret that the list was cut down while all other live stock branches were kept up to the usual money.

The Rhode Island Reds came to the front as the largest and best quality of any breed in the show, thus showing the strong hold they have on the fancy of our best breeders. The champions of the old favorites, the Barred Plymouth Rocks, seemed to stay away from the fray reserving themselves for the Amherst fair. In many of the most popular classes there were not enough entries made to claim the przes offered. This is to be regretted when poultry culture is on the increase and the demands for poultry prices is so great and record prices prevail.

In the utility breeds the Rhode Islaod Reds led in numbers with White Plymouth Rocks and White Wyandottes a poor second and third. While many af these classes were small, many specimens showed class.

In the lighter breeds the White Leghorns led in numbers and quality. followed by the Brown Leghorns as a good second. The largest exhibitors were F. M. Merritt, Hillside Poultry Co., Hartland Poultry Co., E. C. Campbell, Glen View Poultry Yards, A. S. E. Hatfield and Orchard Hill Farm. These men brought out a good string of stuff and made the show.

The highest class and strongest competition in the whole show was found in White Pekin Ducks. This class for numbers and quality was a credit to any show in the Dominion. The Turkey exhibit was small. Some good geese were shown in the Toulouse and White Embern varieties. The pigeon show was up to the mark.

Daniel P. Shove, Fall River, Mass. was judge and as usual he did not please all by any means. W. D. Golding of Sussex made a very capable and popular Superintendent, who, with his staff of capable assistants oleased the exhibitors.

See list of prize winnings on pages 792, 798, 799, 806, 807, 814 and 815.

The Construction of Pig Sties.

Contrary to popular opinion, no farm animal is really so clean in its habits as the pig, and probably none suffers so much if obliged to exist in wet, dirty, cold surroundings. In the case of all stock, any reasonable expenditure incurred in making them thoroughly comfortable is likely to be well repaid by the better return given for the food consumed, to say nothing of the prevention of those diseases which may arise from bad hygenic conditions. The pig is an accommodating animal in many respects, but it is not fitted like other farm stock to withstand great changes of temperature; it is very sensitive to damp, and it may be said that pig-keeping is not likely to be a success unless warm, dry, fairly roomy, well ventilated sties are available. It is equally essential that the buildings should be so constructed that they can be easily kept clean, and disinfected from time to time. If these requirements are not satisfied, the most expensive and elaborate building will most certainly give poor results, while on the other hand, so long as these essentials are obtained, there is no reason why good results should not be obtained in the cheapest possible erection. The common conception of a pigsty is the small low lean-to building opening into an open court. This type of erection has the important advantage of being cheap, but it has serious disadvantages. The only opening into the sty proper is usually so low as to necessitate creeping into it, a fact which militates against frequent cleaning, particularly in wet weather, while it is difficult to inspect the pigs except about feeding time; it is too small and in other ways unsuitable for sows with litters; the building as commonly constructed is dark, badly ventilated, and owing to the absence of a door is either too cold in winter or too close and hot in summer. Furthermore, if it is not required as a pigsty, it is of little use for anything else, whereas a small building, say 10 feet by 8 feet, about 5 feet high at the eaves, suitably lighted and ventilated, and provided with a door in two sections, would not only be much superior as a pigsty, but would be useful for other purposes, e. g., poultry, storage of fuel, etc., if not required for pigs. On farms it is doubtful if, in ordinary cases, the erection of the common kind of sty is necessary or justifiable. As a general rule, all pigs except sows with litters, boars, and those nearly fat can be most economically and advantageously kept in the covered yards with fattening cattle. It is necessary to say that for the comfort of the cattle the number of pigs should not be too large, and for the sake of the pigs themselves they should have a dry corner fenced off for feeding and sleeping. If the manure from the stables is thrown into the yard, it is important to see that it is well distributed, or the pigs will choose it to sleep in, and "cramp" or "rheumatism" will almost certainly follow. For young litters, buildings of the loose-box type, opening and draining into the covered yards, or pens cut off from the yards by walls about 5 feet high, are most suitable, and can be used for a great variety of purposes when not employed as pigsties. There is no trouble with drainage or in the disposal of manure provided that the floors are well above the level of the manure in the yards. Where pigs are kept in large numbers, accommodation such as that suggested is not sufficient, and special piggeries have to be provided. As already mentioned, the essential conditions required by pigs are warmth, dryness, sufficient room, and good sanitation, and so long as these are secured the arrangement and construction of the piggeries can, if desired, be regulated entirely by economy of erection and upkeep, and of labor involved in feeding and tending the pigs. There are, however, certain essential conditions which should be secured in whatever kind of building is erected.

SITUATION AND ASPECT.

If at all possible, a fairly high and dry position should be selected, and in no case should the level of the floor be below the level of the surrounding ground, since buildings so constructed are almost certain to be damp and cold. The doorways, courts, windows, and openings should as far as possible be on the south side. Sties facing north may in some cases be unavoidable, but should never be used for young pigs, except possibly during the hot summer months. Sties for boars, especially sties used for boars to which sows from other premises are sent for service, should be isolated from the sties in which other pigs are kept.

FLOOR.

This in many respects the most important part of the building, and the part in which it is most difficult to combine conditions which are desirable from all points ol view. For instance, for cleanliness, durability and cheapness there is no doubt whatever that a floor of concrete with a skin of smooth cement is the best. Such floors are, however, unsuitable for, at any rate, the sleeping quarters ol pigs; they are always cold, and young pigs reared in houses with cement floors generally do badly, even if they do not develop cramp or rheumatism. Furthermore, if even slightly dirty they are as a rule very slippery. A compromise often made, is to have a cement floor, but to provide a movable wooden platform for the pigs to lie on, and this is good if the stie is roomy enough to allow of the platform being lilted frequently for cleaning purposes. Otherwise, dirt and manure will accumulate underneath. Probably a better plan is to have at least part of the floor laid with asphalt, or to make it of bricks set on edge in cement on abed of concrete. Such floors are warmer than cement, give a much better foothold, and are fairly easily kept clean, though a slightly greater slope is required for efficient drainage.

WALLS.

The walls must be weather proof, substantial and easily kept clean, and may be made of brick, concrete, or stone. Wooden walls can only be regarded as a makeshift, since with them it is impossible entirely to avoid cracks or joints in which manure lodges, while the junction with the floor is always a source of trouble, and unless protected by sheet iron or some such material, the lower part of the wall is gradually gnawed away by the occupants of the sty. If the wall is made of brick or stone, all joints should be pointed with cement or, better still, the wall should be faced with cement to a height of at least 3 feet from the floor. When the sty is intended for breeding-sows, a rail, which is best made of iron tubing about an inch and a half in diameter, should be fixed about 10 inches from the floor, and the same distance from the walls, to protect the young pigs from being crushed. Partition walls need not be more than about 4 feet high, though in the case of a long building some should be taken up to the roof. In case of extensive piggeries it is convenient to have some of the partitions so constructed that if required two or more sties can be thrown into one.

ROOF.

The roof should be weather-proof and non-conducting, and may suitably be tiled, or boarded and covered with galvanized sheeting or thou-

Peas, marrowfat—1, M. B. Harrison, Maccan; 2, Edgar Harrison; 3, D. Innis.

Peas, marrowfat, black eyed.—1, D. Innis.

Peas, field, any variety—1, M. B. Harrison; 2, E. Harrison; 3, D. Innis.

Beans, small, field—1, A. R. Gorham.

Beans, large, field—1, E. Harrison; 2, M. B. Harrison.

Beans, yellow eye—1, A. R. Gorham; 2, M. B. Harrison; 3, B. Goodspeed.

Beans, pink eye—1, E. Harrison; 2, A. R. Gorham.

Corn, Indian, yellow3, Eben Scribner, White's Cove.

Best collection of grain grown in New Brunswick—1, D. Innis; 2, Orin Hayes.

SHEAF GRAIN.

Best sheaf white wheat.—1, Orin Hayes; 2, D. Innis; 3, E. Harrison.

Best sheaf red Wheat—1, D. Innis; 2, Orin Hayes.

Best sheaf Oats, Banner—1, B. Goodspeed; 2, A. R. Gorham; 3, D. Innis.

Best sheaf Oats, legowo—1, A. R. Gorham.

Best sheaf Oats, white, a. o. v.—1, A. R. Gorham; Orin Hayes; 3, D. Innis.

Best sheaf Oats, black—1, A. R. Gorham; 2, Orin Hayes.

Best sheaf Barley, 2 rowed— 1, D. Innis; 2, Orin Hayes.

Best sheaf Barley, 6 rowed—1, D. Innis.

Best sheaf Barley, hulless—1, Orin Hayes; 2, D. Innis.

Best collection Sheaf Grain—1, D. Innis; 2, Orin Hayes.

CLASS 57.—FIELD ROOTS.

White Potatoes, largest, long—1, W. N. Sterritt; 2, B. Goodspeed.

White Potatoes, table, long—1, W. N. Sterritt; 2, B. Goodspeed; 3, F. B. Waters; 4, A. R. Gorham.

White Potatoes, largest, round— 1, B. Goodspeed; 2, W. R. McFate; 3, A. R. Gorham; 4, F. B. Waters.

White Potatoes, table, round—1, A. R. Gorham, 2, W. F. McFate; 3, F. B. Waters; 4, Orchard Hill Farm.

Red Potatoes, largest, long—1, B. Goodspeed.

Red potatoes, table, long.—1, W R. McFate; 2, B. Goodspeed; 3, F. B. Waters; 4, A. R. Gorham.

Red Potatoes, largest, round—1, W. N. Sterritt; 2, B. Goodspeed.

Red Potatoes, table, round— 1, B. Goodspeed; 2, W. N. Sterritt; 3, F. B. Waters.

Black Potatoes, largest, long—1, B. Goodspeed; 2, W. R. McFate.

Black Potatoes, table, long—1, W. R. McFate; 2, B. Goodspeed.

Black Potatoes, largest round—1, W. R. McFate; 2, B. Goodspeed.

Black Potatoes, table, round—1, B. Goodspeed; 2, F. B. Waters; 3, W. R. Waters.

Best collection Potatoes—1, B. Goodspeed; 2, F. B. Waters; 3, W. R. McFate.

Swede Turnips, largest—1, Orchard Hill Farm; 2, B. Goodspeed; 3, F. B. Waters.

Swede Turnips, smoothest—1, B. Goodspeed; 2, A. R. Gorham; 3, W. N. Sterrit.

Turnips, any variety for table— 1, B. Goodspeed; 2, F. B. Waters.

Carrots, red—1, Geo. Stiven, Chatham; 2, Orin Hayes; 3, F. B. Waters.

Carrots, white—1, Orin Hayes; 2, W. N. Sterritt; 3, A. R. Gorham.

Carrots, Chantenay, half long, scarlet—1, F. B. Waters; 2, B. Goodspeed.

Mangel, Wurtzel, red—1, Orin Hayes; 2, B. Goodspeed; 3, F. B. Waters.

Mangel, Wurtzel, yellow globe— 1, Orin Hayes; 2, F. B. Waters; 3, A. R, Gorham.

Mangel, Wurtzel, golden tankard—1 Orin Hayes; 2, F. B. Waters; 3, B. Goodspeed.

Sugar Beets—1, Orin Hayes; 2, B. Goodspeed; 3, F. B. Waters.

Pumpkins, largest by weight— 1, F. B. Waters.

Best collection Field Roots—1, Orin Hayes; 2, B. Goodspeed; 3, F. B. Waters.

Best exhibit of Field Roots and Garden Produce—1, B. Goodspeed.

Best exhibit of Potatoes—1, B. Goodspeed.

Best and largest collection of vegetables grown from Burpee's Seeds—1, B. Goodspeed.

Best exhibit of roots and vegetables grown for Bowker's Fertilizer Company's Special prize—1, B. Goodspeed.

Garden Vegetables

Cauliflower—1, Samuel S. Linton; 2, F. B. Waters; 3, Orin Hayes.

Cabbage, white,—1, Samuel S. Linton; 2, Orin Hayes; 3, F. B. Waters.

Cabbage, red—1, F. B. Waters; 2, S. S. Linton.

Savoys—1, F. B. Waters; 2, S. S. Linton; 3, Geo. Sriven.

Brussels Sprouts—1, F. B. Waters.

Carrots, oxheart—1, A. R. Gorham; 2, F. B. Waters; 3. B. Goodspeed.

Carrots, early horn—1, F. B. Waters; 2, B. Goodspeed.

Parsnips, hollow crown—1, George Stiven; 2, Orin Hayes; 3, B. Goodspeed.

Parsnips, intermediate—1, Orin Hayes; 2, B. Goodspeed.

Clery, white—1, Geo. Stiven.

Celery, white plume—1, Geo. Stiven.

Tomatoes, red—1, A. R. Gorham; 2, Eben Scribner.

Tomatoes, green—1, A. R. Gorham; 2, Geo. Stiven.

Tomatoes, best collection—, 1, Eben Scribner; 2, Edgar Harrison; 3, M. B. Harrison.

Beets, blood, long—1, B. Goodspeed; 2, F. B. Waters.

Beets, Egyptian—1, Geo. Stiven; 2, S. S. Linton; 3, B. Goodspeed.

Beets, eclipse—1, F. B. Waters; 2, B. Goodspeed.

Onions, white—1, Eben Scribner; 2, B. Goodspeed.

Onions, yellow—1, Geo. Stiven; 2, Eben Scribner; 3, W. R. McFate.

(Continued on page 813)

Sheep on the Farm.

The importance and profit of a flock of sheep on the average farm is too often disregarded and minimized by the negligence and lack of care on the part of the farmer. Too many farmers have an idea that a sheep is simply a sheep and because he is a sheep he needs no care and but little feed. When the results of such methods prove profitless these same men declare that sheep do not make money, and thoughtless observers unacquainted with the facts and conditions are quick to proclaim sheep-raising on the farm a failure.

It is a strange fact that the sheep has received little consideration from the agricultural colleges and the majority of the farm press. The ways of our grandfathers have seemed good enough for the handling of sheep on the farm, and when interest has lagged and improvement has been neglected men have said that sheep do not pay. When we have seen how some farmers have handled their sheep we have wondered not that they did not pay, but that they even lived.

The trouble is principally neglect in the care and feed of the flock, and failure to realize the value of good straight breeding. The result is the production of an inferior lamb or sheep. If a fleece is obtained it is of nondescript character and uncertain grade, generally filled with chaff, burrs and other foreign material, wrapped with an unnecessarily large amount of such twine as leaves its fibers intermixed with the wool. Such wool is obviously not worth as much as a well grown fleece put in good condition.

Farmers must realize that it requires feed to grow sheep, just as it does to grow cattle or hogs. Sheep will live and thrive on much feed that is of little value for other stock, but that does not imply that they can do without. One cannot turn a flock of ewes or lambs into a stubblefield, leave them there until there is nothing for them but the bare stubble to eat, and often without water, and then expect the lambs to grow fat and the ewes to grow good fleeces. Likewise in winter, it takes feed to keep the breeding ewes in condition so that when spring comes one may get a large percentage of strong, healthy lambs and at the same time a fleece of good staple and weight. One cannot get something for nothing in this world, nor can we grow mutton and wool without feed.

Along with care and feed goes good breeding. "Blood will tell" applies to sheep as to all other animals. It would seem as if its importance, had been sufficiently demonstrated, but when one drives through the country or sees the sheep come into the stock yards at the market centers, he is amazed at the various breeds and crosses, especially the latter, that appear. It is right along this line that improvement is required. There must be more uniformity in the breeding of the average farm flock, and with this more continuity of purpose.

Years ago when wool was the main purpose with sheep, Vermont Merinos always tending toward the wrinkly type, were practically the only breed. But when mutton came to be a valuable product this wrinkly Merino was emphatically condemned by the market men, and every grower was advised to sell his Merinos and to breed a mutton sheep, for the wool was of no value and never would be again. The only sheep in mind was a black-face or a long-wool, according to the personal choice of the market man. The result was a nearly universal crossing of those old flocks with mutton rams of the breed generally recommended by the market man in that neighborhood. From that time on many farmers who keep sheep have been crossing and re-crossing breeds. Like a weather-vane in the wind, too many farmers change their mind as to the breed they want with every change in the market, and it keeps them so busy changing that they never have time really to determine on some one breed and purpose and stay with it.

Some well known sheepmen advocate the standardizing of breeds by localities, but it seems as if quicker and better results could be obtained by emphasizing the importance of uniformity and pure breeding within the individual flock. It makes little difference what breed a man selects so long as it is adapted to his conditions of production and market, but it is important that after he selects that breed he continue with it. He cannot improve his flock by crossing it with rams of other breeds.

Sheep have just as important a place upon the average farm as any other live stock, but they must be given intelligent feed and handling to produce maximum profits. That they do pay is amply demonstrated in those sections where they have been maintained for any length of time and given intelligent care and breeding—Roscoe Wood, in Breeders' Gazette.

The Public Sale of Pure Bred Breeding Stock.

As a system of selling "purebred" stock the public sale affords so many positive and distinct advantages that argument for the method would seem unnecessary. The efficacy of the system is clearly evidenced by the fact that our most active and successful present day breeders have adopted it, and that the foremost breeds of live stock are those which have been kept conspicuously before the public eye by the auction method. So generally established and so popular has this method of selling and buying registered live stock become that the breeder who does not follow the custom is looked upon by the public with a degree of indifference and suspicion, while the breeder who manifests a confidence in his neighbors, permitting them to compete publicly for his goods, wins their confidence and will command their patronage just as long as he gives them clean and honest actions.

The public sale is unsurpassed as an educator upon the matter of values, types and breeds and gives great impetus to the improved stock breeding industry. The public sale proposition is not clothed in mystery that should cause a breeder to hesitate and doubt his ability to make a successful sale and undergo the monotony, uncertainty and disappointment attending the private sale business. Far from being so, the process is very easy and the results gratifying if one will but observe and carry out the details pertaining thereto.

First: The character and standing of a breeder among his neighbors is essential. If the public esteem a man's word, and know him to be honest, personality other than this is of little consequence. I have in mind a great number of breeders who might not be termed "smooth" or "clever", but better, they are honest, and their sales are always successful.

Second: The sale offering should be presented in good breeding condition, doubtful and inferior animals should in no case be listed.

This does not imply that every animal must be a high class individual, but those that are not superior to the common stock of the community should by all means be eliminated.

Third: The sale should be dated far enough in advance that the offering may be shaped up for the occasion, and also allow a sufficient time in which to thoroughly advertise the sale. Advertising is very important, and I heartily commend the use of the agricultural press. A sale offering which will not justify advertising in a live stock journal, should not be sold for breeding purposes. In addition to these, a sale should be given notice in the local papers covering a radius of fifteen miles. Ten days prior to the sale, bills should be posted at cross roads and in business houses in the local territory, and a general announcement of the auction made over the local phone lines the evening before the sale. Sale catalogues should be gotten out by the time the first advertisement appears so that inquiries may be promptly supplied. Ten days before the sale mail catalogues to these on your mailing list, which should in addition to the breeders' names, include those of fifty or more farmers living nearest to you. Follow this with a circular letter, or postal card notice three days before the sale. See that your catalogues are complete, and free from error, using footnotes that will do the animal justice without exaggeration. Solicit mail bids to be entrusted to your field-men or auctioneer, and reserve 150 catalogues for sale day.

In determining upon whether to hold the sale, you should consider the convenience and comfort of the public. As a general thing, it is better to hold winter sales in town, however, there is no established rule on this point. If sale is a driving distance from town furnish free conveyance and see to it that the service is prompt. Furnish free entertainment to parties from a distance and have free lunch for every one.

Fourth: Provide a comfortable place in which to hold the sale. If there is no barn suitable for the purpose, do not hesitate to hire a good tent. Have seats for the crowd and be sure that seats are secure. If a swine sale do not have the ring more than 18 feet across, enclosed with patent fencing 30 inches high bringing seats well up to the ring. For cattle and horse sales a larger ring is, of course necessary.

Fifth: Class and arrange your stock in the pens or stalls so it will appear to the best advantage, numbering each animal so as to correspond with the catalogue number. Number swine with paint, and place number on back just behind the shoulders. Never depend upon ear tag numbers for the sale ring, and be sure there is no error in the numbering. For cattle place cloth, or paper numbers, by pasting on each hip, and for horses attach numbers to halter. It is always best to number your offering the evening before sale, or very early sale morning. Never delay numbering until the crowd is arriving. Procure a sufficient number of helpers and give instructions so that each will know what is expected of him. Arrange entrance and exit to the sale ring, so there can be no delay in getting the stock in and out. Everything should be completed and ready by nine o'clock sale day, with nothing for the proprietor to do but receive the guests and look after their comforts. Extend to your neighbors the same courtesy as to those from a distance, and make every one feel at home.

Sixth. One hour before sale time, have lunch served, and have plenty. Be ready to start the sale on time. With your helpers instructed as to the order in which the stock will be sold, your place during the sale is near the auctioneer. Be prepared to answer all questions regarding the stock, and do not withhold or cover up any of the facts. Be brief and to the point and also be pleasant. If an animal sells for less than you were expecting, do not complain, for the next may bring more than you expected. At this particular time in the sale, the success with which you are to meet depends entirely upon the ability of the auctioneer on the block. If you have employed an expert sales man, a man who is familiar with every phase of the business now at hand, you have done nicely. But if you have tried to save a few dollars by hiring an auctioneer whose only recommendation is a low fee, and and placed within the hands of an inexperienced salesman, the responsibility of getting you a reward for your effort in caring for the offering, and getting ready for the sale, may the good Lord pity you. Employ the local auctioneer through courtesy and to prevent a hard sale being held in the neighborhood the same day. He can also help in advertising, and work in the ring. The "field-men" representing the live stock journals in which you have advertised the sale are all good ring men and they are always ready and willing to help a sale in every possible way. Where you expect them to help in the ring, always supply your clerk with a few sheets of carbon paper, so that he can furnish each of them with a complete list of the sale when it is concluded, and thus avoid the delay entailed by the ring-men also having to clerk sale while it is in progress.

Seventh: Employ an experienced clerk, and have your pedigrees all made out in advance of the sale, leaving them with the clerk to give to the buyers when settling. Instruct your clerk to settle with the advertising men and auctioneer just as soon as the sale is over. Be as interested in conveying parties back to the station and saying good-bye to them as you were in greeting them. Make every promise and agreement good, and you will find your reputation extending from year to year, your sale averages increasing, you will become an exponent and advocate of the one great effective method of selling and you will attain a success otherwise impossible.—H. S. Duncan.

Black Soils.

The black soils in different parts of the globe are remarkable for their fertility, and abundant crops are harvested off them year after year without any apparent decrease of productive capacity—we say "apparent" because the continual extraction of plant-foods must sooner or later impoverish even the richest land.

Such soils exist in parts of Morocco Russia, Australia, Canada, and a few other places.

The most remarkable black soil is probably that of Russia. It has been calculated to cover an area of 60,000 square miles and, while supplying food for a population of about 20,000,000, yet produces an enormous surplus of wheat for export. It extends right up to the borders of Hungary, and forms the largest extent of similar fertile soil known to exist.

Its depth varies from 1 or 2 to 20 ft.; when moist, it is jet black; when dry, of a dark brown. The dark color from which it derives its name, "Tchovnoi zem," is due to the presence of large quantities of organic vegetable matter in a peculiar decomposed mix with mineral matter.

The richness of the mineral constituents of the black soil, a rich sample, is shown by its contents in a dry state:—Potash, 5.81 per cent; soda, 2.31 per cent.; lime, 2.60 per cent.

This abundant supply of the essential mineral substances combined with the rich organic matter, is sufficient to afford an explanation of the exceptional fertility of the soil.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

GOOD JUDGMENT.

Good judgment in conducting a dairy farm is a somewhat rare quality. Yet, not so rare but that many farmers possesses it. It also seems to be of slow growth, for a well conducted farm will exist for years in the midst of poorly conducted farms without the operators of these farms noticing it. There is a question of judgment involving here. And here breaks in a serious of questions that we have heard asked hundreds of times.

"Must a farmer be a thoroughly educated man to have good judgment ?"

"What is good judgment and in what does it consist ?"

"Do you measure it solely by the fact of making money on the farm ?"

"Why is it that we often see a well educated man of good intellect who seemingly cannot succeed as a dairy farmer ?"

"Why is it that some men succeed fairly well, who are not well educated, who do not surround themselves with books and papers as do the men who come from the schools ?"

"Must the farmer be a chemist in order to have good judgment of soils and how to manage them ?"

"Must he be a man learned in animal physiology in order to understand well the cow and how to make a profit from a herd of cows ?"

"Can't we have good judgment and do well at dairy farming without all this fussing with what we call the intellect ?"

"Why should a man have a bench full of expensive tools when some men can do so much and do it well with a jack knife?"

The foregoing questions fill the middle ground between the so-called scientific dairyman and the average dairy farmer and the latter is constantly asking them. What answer will our readers make to any one of them ?

The average dairy farmer does not like the idea that with all his experience he is not better fitted to exercise than any other man. We are not prepared to say that he is not, but the fact remains and is staring us in the face that a great host of such men are not succeeding well at the business.

Their farms are running down. Crop growing is yearly getting more and more hazardous with them.

Have they good judgment ? Are they managing their soil rightly when such is the result.

There is a difference of two to five hundred per cent in the net profit per cow between farmers in the same neighborhood on farms on the same natural quality.

Is the quality of the judgment the same in both cases ? Both have had experience, What is the matter with this low per cent man ?

We want some of our readers to fire at one or more of those questions. We need help in solving them.

Our New Serial Story

THE first instalment of our new serial story appears in this issue of the Maritime Farmer. The interesting and world famous story, David Copperfield, by Charles Dickens is one that always stands re-reading. Those of our readers, who have previously read this story will be delighted to read it again, while many of our readers, who have never read it before, will eagerly await the coming of the mailman on Maritime Farmer days. We are sure that there will be many happy gatherings around the family circle as the story is close followed from issue to issue. Now would be an opportune time to ask your friends to subscribe for THE MARITIME FARMER. Tell them about our new serial story and the other good points of The Maritime Farmer. They will thank you for bringing it to their notice. Speed the good work today.

AN INVESTMENT FOR FARMERS.

A group of farmers were one day talking together about farmers' investments. One man declared that mortgages on farms could be had, realizing five per cent., and they were investments that farmers knew a good deal about. Another anvocated putting surplus money into the banks, for though the interest was low yet the money was safe, and could be got at any time. A third, however, the richest of the party, then gave his views, and he was listened to with attention. "The practice I have followed for many years has been, I am convinced, more profitable than any other I could have taken to. Every time I have found myself with any surplus money I have invested it in some way or another on the farm. Either implements, or fresh stock, fertilisers, repairs, extra hired labor or something else offered itself for attention and the result proved it a most profitable investment. If you want a good use for your money, put it back into the farm, just as the city man puts his money back into his business."

PLAY TO YOUR MARKETS.

A wise butter maker on being asked whether he considered it right to use butter color answered that, if the market demanded Paris green in butter he would put it in. To succeed in the producing of butter or of beef the requirements of the purchaser must be complied with. The standard of the beef market has changed greatly in recent years. Not many years ago the best markets demanded large thick bullocks, weighing 1,800 to 2,000 lbs., but the demand has changed and cattle of that description are no longer sent forward. The bullock that demands the highest price is a compact, well finished animal weighing not more than 1,500 lbs. on foot and if he weighs only 1,200 lbs. he will command the highest market price, provided he has the form, quality and finish. Even the thousand pound 'baby beef' is looked for by the man with the money on this side of the Atlantic, but such cattle are not shipped abroad. The change is greatly to the advantage of the producer, as other things being equal, the younger the animal goes to market, the less is the cost of food and the greater the profit to the producer. The British market demands cattle of moderate weights, good quality, and carrying sufficient fat in connection with the lean meat to secure a high degree of excellence without waste. To secure delicate flavour and tenderness a certain proposition of fat is necessary and this should be incorporated with the flesh or lean meat rather than appear only as a covering to the muscles. The great secret in procucing a carcass of beef is to treat an animal in such a way that the fat grows with it during the entire period of its life time. It is unfortunately the too common practice of Canadian beef raisers to produse all that fat that an animal carries in the course of a few months. Much of the fat put on in this way is deposited on the outside of the carcass; it is largely wasted as it is useful for little else than tallow. The carcass that dresses out showing specks and streaks of fat throughout the lean tissue commands the highest prices. Such beef is regarded as much of a delicacy as the finest turkey or lamb. The only way to be sure of prime quality is to maintain the animal in good condition by a system of liberal feeding from birth to maturity. Then the finishing period is comparatively short and the carcass produces the highly desirable marbled beef.

MARITIME FRUIT INSPECTORS.

The Dominion fruit inspection service plan for the seaion 1912—13 has just come to hand. A new position, chief inspector has been created in each of the five fruit districts into which Canada is sub divided.

The inspectors for Nova Scotia are:—G. H. Moore, chief inspectors, A. S. Alcorn, W.C. Healy, Stuart Dimock, and Geo. Akins, inspectors at Halifax, and F. B. Westcott and Wm. Bishop, inspectors in the Annapolis Valley. Chas. M. Williams is chief inspector for Prince Edward Island and S. L. Peters occupies a similar position in New Brunswick.

EDITORIAL NOTES.

What plans have you made for better school this fall ? This work is not for teachers and school officers alone; the patrons and friends of the pupils should have a part.

Corn in Adverse Years and in Years of Plenty.

After four days' drive through the centre of Prince Edward Island, during which I discussed the condition of crops with several farmers, in the various localities which I visited, I believe this will be a fairly favorable season for the average farmer. Good growing weather in May favored the growth of grass somewhat earlier than usual and early sown grain started up very fast; but the cold wave experienced all through the month of June greatly hindered growth, so much so that the middle of July found crops rather backward, for that time of year.. Since the middle of July, abundant rains following excessive heat brought everything on in good shape, and there was time for grain to recover from the June setback. Hay was well up to the average; potatoes, everywhere, looked well, turnips are patchy in most places, but corn, where it is grown, is regular and strong.

This has been a peculiar season with its extremes of cold and heat, drought and moisture and one that emphasizes the necessity of a variety of crops. It is wonderful to note the persistency with which a great many farmers stick to the staple Island crops, hay, oats, and potatoes, the latter being always sold and thus leaving only a choice of the other two, with the exception of a small amount of turnips, for stock feeding.

Now, granted that in good growing seasons this variety may answer the requirement of the mixed farmer, as everything one can grow sells readily, it should be the aim of every farmer to so create conditions of fertility of soil and grow a variety of crops so that he may be prepared to cope with adverse weather conditions and be reasonably sure of a sufficient supply of feed, under any condition that is likely to occur.

While there may be more fertile lands and greater opportunities for a few fortunate individuals to acquire prosperity in the West and South West of the Maritime Provinces, Prince Edward Island is nevertheless a good place in which to farm.

When we read of the cyclones, the hailstorms, the early frosts and the destroying floods that so suddenly ruin most promising crops, as is frequently experienced in the West, we should be thankful for our temperate climate, where conditions are such that we are assured profitable returns each and every year.

No farmer should be satisfied with merely holding his own by keeping just the same number of live stock and manuring just the same small acerage year after year. If we live up to our opportunities, whatever they may be, we should, year by year, be found growing a little larger acerage of the heavy producing crops and keeping a few more cattle and feeding those we carry better. For this reason, I think about all the manure produced on a farm should be used for growing roots and corn. If these crops grow well, they will be followed by a good crop of grain and subsequently by hay or pasturage as we desire.

About twenty years ago Professor Robertson toured our Island Province preaching the doctrines of dairying, corn growing, silo building, an the growing of all succulent feeds. Co-operative dairying, the most suitable and, in every way, the most favorable industry ever established on Prince Edward Island was thus introduced and a large number of silos were built.

I was only a boy at the time and had no part in the pioneer silo days, but as I look back now I wonder that so many silos were built and so quickly abandoned. It was almost a stampede in and out of corn growing and while quite a number of silos are still in use, in this province, very few indeed of the pioneers are amongst the number. The effect of the outward stampede is hindering many, who are now giving the question of corn growing some thought, from erecting a silo.

As this is the sixth consecutive corn crop we have successfully grown for the silo, I am beginning to think that we can grow it every year, as I do not expect to ever meet more unfavorable seasons than we experienced during the past six years, the present season included. Few crops are as hard to injure as corn, from the time it is through the ground until it is fed. It is too tough for the cut worm; no flies, blights, rusts nor droughts affect it. When it gets too dry for anything else to grow, corn keeps right on growing. A slight frost prematurely ripens it and if heavy necessiates cutting and prevents further cobbing, but does not spoil its feeding qualities, as bad weather will affect hay, and once in the silo, neither excess of heat nor cold can injure it, nor will the length of time it is kept spoil its feeding value. When we can grow from ten to twenty tons of corn per acre, and it usually grows in years that hay will not grow, why do not more of our Maritime farmers grow corn for the silo ?

I think that some are hindered in this work, as I was for some years, by the experience of some of the men who abandoned the silo. For several years, I have known them to fail to get a stand—it seemed the ground was too cold and damp for the kernels to germinate. I believe the trouble was that the ground was not properly cultivated. The usual custom was to summer fallow a piece of sod land and before planting it was plowed again. While this made a good seed bed, in a warm season, it did not give underdrainage enough during a cold, damp season.

I have grown corn several times following both fall plowing and spring plowing systems in the same season and after closely following tne results of my own work and the experience of others I would not now risk growing corn on any but spring plowed sod, manured dther the previous fall or as early as possible in the spring, with a manure spreader which spreads so fine that the grass is not buried anywhere after which the grass will make wonderfully rapid growth—this makes the manure grow more manure. We plow this grassy field about the last of May using a skimmer plow, set to skim a deep roll of soil out into the furrow, which answers the double purpose of preventing the grass from starting where the furrows join, and the turned soil falling on the grass in the furrow so loosens up the sod that after-cultivation is greatly aided. We diec or double disc this soil until we work up a good deep seed bed and then we plant our corn with a disc drill, in rows thirty-five inches apart. It takes a little over one-half bushel of seed corn to the acre. Land so treated will have a thick, heavy growth of grass and manure starting to heat under the corn. We get some grass to keep the cultivator busy and also some couch, if it is in the soil, but we get good corn with well matured ears every time.

The season of 1910 had a cold wet June and the half of our corn was on summer-fallowed sod land. The other half was on an adjoining p lot that had been spring-plowed sod treated as above described. The crop on the summer-fallowed plot was not nearly as good and cars were much inferior in filling qualities and maturity to those on the spring plowed plot. On some other years we did not see such a marked difference in the bulk of crop but the ears were always better and the corn grew more regular on land prepared by manuring grass land and following the practice of spring plowing and after cultivation as I have already described.

Turnips are a splendid feed—there is nothing that can just take their place and so we always grow large quantities of them. But we should have corn too. This is the only safe way to be sure to have plenty of feed. It seems such a pity to see whole sections of a province importing hay by the car load, as the farmers of the eastern end of Prince Edward Island were compelled to do last year. Had each farmer his corn crop and silo he could have had sufficient feed, even if the hay and grain crops were both light.

Don't waste any sympathy on the men you see buying mill feed and perhaps a little hay, after growing a large quantity of roots and corn. If he grows good crops of these, he will grow good crops of grain and hay, and if he has enterprise enough to buy mill feeds to supplement his farm-grown crops, you may rest assured that he will have wit enough to feed it to some class of live stock that will recompense him for his trouble.

On the other hand, the man who is compelled to purchase high priced hay to carry his stock through the winter, earning nothing in return, is deserving of sympathy and something else.

Such a man shodld be persuaded to take up a variety of crops. On our one hundred and twenty-five acres of cultivated land, some twelve years ago, six acres was all that could be dressed with stable manure in one season. By feeding better and growing more roots and corn we now dress from twenty-five to thirty acres each year and grow a great variety of crops, this season, including six acres of corn, seven acres of turnips and four acres of potatoes. The remainder of the manure, not used on the above mentioned crops, was used as a top-dress on grain. If our hay or grain crops are light, which is not the case, we have always a full crop, of at least, one of the others which yields an abundance of feed.

Now, I would not wish to advocate the growing of corn instead of turnips—we need them both in this province. I like to pass a farm where both are grown in quantity for I am assured that every other crop will grow after them and the manure produced by feeding them on the farm and the good cleaning their cultivation gives soon puts the owner on the road to prosperity.

Do not let the fact that several abandoned silos are in your immediate vicinity hinder you from giving corn-growing your serious thought. To the man who has a timber growth on his place, a silo need not cost very much after he has a concrete base or foundation built about three and one-half feet in the ground. The silo may be square framed and double boarded up and down with tarred paper between and joints carefully broken, the corners on the inside being cut off about one foot so that the ensilage will pack in better than if they were square. A silo of this kind keeps corn perfectly. No part of it will spoil excepting a little on top and even the latter may be avoided or, at least, reduced to a minimum by covering the ensilage with a foot or so of fine hay or seaweed, immediately after the silo is filled

We cannot grow any other crop that will give such an amount of feed, with the same expenditure of manure and labor as will corn. We cut our corn by hand and use a corn blower. The elevator is not satisfactory as it is too easily put out of commission, causing a lot of delay and added expense.

Ensilage cutters and blowers are not very costly and a good machine may be owned and used co-jointly by neighbors. A little experience will soon teach one how to make good ensilage. We like to leave the corn as late as possible to get all the ear-growth we can. A little frost does not injure it, in fact, my impression is that frost actually improves it, as the leaves being a little withered and dry take up excess moisture and the silage is not so apt to sour. However, if a heavy frost strikes your corn, cut it as soon as possible and little injury is done only, in this case, if the weather is dry, use some water.

There are two extremes to be guarded against, if the corn is too green and moist the ensilage will sour, and if, on the other hand, the corn is too dry the ensilage may mould. As our corn is usually a little frosted before we cut, we put it into our silo pretty damp. The firmer it is tramped the better, particularly around the walls, corners and on top. When the silo is full, plenty of water may be splashed on top to make it thoroughly wet. A lot of heat will soon develop and, while the mass is settling, it should be well tramped every day, so that there will be few if any air spaces. This will give better ensilage near the top and when the silo is opened for use nothing can injure it. Mice will not touch it, neither rain, snow, heat nor cold affect the feeding qualities of ensilage. It can be stored in a small area and every claes of live stock like it. Corn is a good feed in a year of general good crops and a bonanza in a year of drought. — W. A. Lea, Victoria, P. E. I.

Smut in Oats.

In making a careful examination of the oat fields entered in the Kings County, N. B., Crop Growing Contest, Mr. Fiske, the judge, reports that smut was found in nearly every field. The Farmer has also heard a great deal of complaint re the prevalence of smut this year from a great many farmers other than those who participated in the contest.

Smut is one of the most serious propositions which grain growers have to deal with from year to year. It is a serious proposition because of the decrease in oat production due to oat smut. In order to know exactly what the damage due to smut amounts to all one has to do is to measure plots two feet square in about six representative points in each field. Then make two counts, first counting the total number of stalks and second the number of stalks infected with smut. After making the count calculate the results. In some cases it will be found that nearly ten per cent. of the oat heads will be filled with smut which means a loss of about five to ten bushels per acre.

The question now arises as to how farmers are to combat the smut. The answer is to treat the oats in the spring just before sowing and save from five to ten bushels per acre.

HORTICULTURE.

The Thinning of Fruit.

It is only a few years ago that any of us first understood at all definitely what was meant by "thinning fruit." Now practically all commercial growers instinctively think of the removal of some of the fruits at an early stage on their growth, to permit of the greater perfection of the rest.

What was unheard of a few years ago becomes widely talked of today, and is the common practice of tomorrow. This has been the history of spraying throughout the apple districts, while pruning has gone through a similar evolution, though in a more irregular fashion.

Thinning as a feature of orchard practice on a large scale was probably first adopted in California, and was soon after applied to apples and pears in the producing districts of the Pacific Slope. It is in these districts that high fraght rates and a long haul to markets has made essential the production of the greatest possible percentage of high-class fruit.

Only good fruit can be sold at a profit in western packages and under transcontinental freight rates, but the valuable lesson was learned that care in all features of production results, not in a minimum of profit, but in a maximum of profit; in other words the high expenditure per acre involved by intensive methods produces not a lower profit per box of fruit, but a higher one. The West has taken this lesson to heart and the changing market conditions are bringing it home to the East as well.

The British Columbia grower never asks himself if thinning pays any more than he asks whether pruning or cultivation produces a profit. About spraying, especially in those districts where San Jose scale and the codling moth are unknown and where apple scab and similar fungous diseases have never been seen by the average orcharist, he does raise a question, but the cost of pruning, cultivation and thinning he does not question any more than he questions the box package or the wrapping of high-class fruit.

Until varieties of peaches, apples and pears are produced that reach the commercial standard of perfection without pruning and thinning (and such varieties are a long way off as yet), these practises, which go hand in hand, will continue to be two of the most important in the orchardists' calendar.

In the East a similar view of the matter will in the near future obtain. Progressive growers will experiment and their results will shortly lead to the adoption of thinning as a part of orthodox orchard practice as it is now in the West.

In discussing the question of thinning we admit that a tree may set more fruit than it can possibly bring to perfection, as the fruit grower understands perfection. Nature cares nothing for the fruit except as an aid to produce seed; the orchardist cares nothing for seed except as they are necessary to the production of fruit. We wish each tree to carry all the fruit it can bring to commercial perfection, and no more. At the same time the tree must make new vegetative growth consistent with its age, and the variety. The third requisite is that it should also form enough fruit spurs for a similar crop in the following year.

When a tree is fulfilling these three requirements, it is performing its maximum duty to the owner. If it falls short in any of them he is not getting his maximum of profit, either immediate or prospective from

One Roofing Used Twice

After fighting smoke, burning cinders and storm for seven years, the roofing shown above on the old Wells Street Station of the C. & N.W. R. R. in Chicago, was rolled up and used to re-roof several suburban stations.

NEPONSET PAROID ROOFING

This hard wear has not taken a bit of the life out of the roofing, and it is now giving perfect service in its new locations. A good life insurance risk is the man who lives beyond the average time—longer than he is *expected* to live. A good roofing is one that lasts *longer* than is necessary. That's what NEPONSET Paroid does. An ideal roofing for factories, storehouses and farm buildings.

Blue Print Barn Plans—FREE

They are the kind of plans that appeal to every Canadian farmer.

NEPONSET *Roofings are made in Canada*

Winnipeg St. John, N. B. Vancouver, B. C.

RU-BER-OID Roofing

TRADE MARK REGISTERED.

Lessens Fire Risks

Fire Insurance Companies assess buildings covered with Ruberoid at the "base" or lowest rate.

That is because a RU-BER-OID Roof will not catch fire from flying cinders or even burning brands—and because the one-piece, air-tight, fire-resisting RU-BER-OID Roof helps to hold down a fire starting within.

RU-BER-OID Roofing will not warp or crack like shingles—rust like metal roofs—nor rot, dry out nor crumble as so many ready roofings do. It gives fuller and more lasting protection per dollar of cost than does any other roofing.

Made under Canadian Patents 93,027 and 93,160, in 3 Permanent Colors—Red, Brown and Green—and in natural Slate. Write for Samples and Booklet, "RU-BER-OID—Why?"

it. This ideal is the foundation of our orchard practice.

The removal of some of the fruit at an early stage in its growth helps materially towards securing the maximum duty of the tree in certain definite ways.

First, the average size of the fruit left on the trees is increased; this is the most obvious result of thinning. Trees overburdened with fruit produce a greater percentage of number two apples. The increase in size of the remainder, after the first or second pickings of Bartlett pears is made, is a striking instance of the increase in size when the number of fruits is reduced.

Second, the fruit borne is more uniform in size and shape. On the overloaded tree there is much variation in size, and especially where two or more fruits remain on a spur they are variable in shape as well. The fruits from the side blossoms of the cluster are in many varieties much different from those from the centre blossom, usually being flatter in shape and having a considerably longer stem. Uniformity in size and shape is an important essential of commercial perfection.

Third, the color is materially bettered, more uniform, and comes earlier. The remarkable increase in color which occurs when a first picking is made from heavily bearing trees of even the Winter varieties such as Jonathan and Wagener, furnishes a striking confirmation of this point, while color seems largely related to sun-shine, it is a well known fact that on a heavily loaded tree the fruit has less color less evenly distributed, and more slowly acquired.

Fourth, thinning improves the quality. This is especially the case when the soil is deficient in moisture or plant food.

Fifth, the fruit is freer of diseases and insect pests, because wormy apples, limb-bruised or diseased fruit of any kind can be removed at thinning time. On plums and peaches in moist regions, fruits thinned so that no two touch when full grown, are much freer of brown rot.

Sixth, the removal of misshapen fruit lowers the percentage of low grade fruit.

Seventh, thinning prevents premature dropping. A familiar instance is that of the McIntosh Red, which is especially liable to drop where two fruits are left on one spur. Premature dropping is quite largely due to the inability of the tree to supply moisture to an excessive crop.

Eighth, the load of fruit is more evenly distributed, and this is a very important feature in preventing the breaking down of trees.

Ninth, the cost of picking is reduced considerably, and the labor of packing is divided more evenly over the season. This is an important advantage where the supply of labor is deficient in picking time. The costs of grading and packing are also much lessened.

Tenth, less fertility is removed from the soil, a ton of apples takes out approximately 1.2 pounds of nitrogen, 1.6 pounds of potash, and 6 pounds of phosphoric acid. A ton of pears removes the same amount of nitrogen and about twice as much of the other elements. The seeds take the great bulk of these amounts, the pulp of the fruit taking but a small portion. As the number of seeds is roughly in proportion to the number of apples, and not to their size, the removal of fruits leaves a much greater supply of plant food for the balance of the crop, for the growth of the tree, in the soil.

Eleventh, the tree is less liable to Winter injury. The extensive injury suffered throughout Ontario by the hard Winter of 1903-4 fell mainly on the trees which had borne an overload the previous season. This is a natural result because the ripening of the crop drains the vitality of the tree, so leaving it in poor shape to withstand the winter. Trees bearing moderate crops for which there is an adequate supply of moisture have sufficient vitality to ripen the crop, and to ripen the fruit buds and new shoots as well.

Twelth, one of the most important results of thinning is that trees will bear a larger and more uniform crop the following year. The tendency towards biennial bearing is materially reduced, much depending in this, however, on the variety.

For various reasons, then, thinning helps materially to secure the maximum duty from the tree.

As soon as the crop can be determined and the supply of labor permits thinning should be commenced. Start with those varieties which are most advanced. Generally, apples, about the size of a hickory nut, and pears and peaches are thinned when the thinning should be completed before they are more than double that size. On the various plums the work should be commenced as soon as possible after the dropping, familiarly known as "the June drop" is over.

Apricots, cherries and crab apples are not usually thinned by hand, because the crop which they are to bear is a reasonably certain quantity, and can be controlled to a greater extent than in the larger fruits by proper pruning. The Italian prune and the peach plum are not usually thinned, because normally the set of fruit of these varieties is not great enough to necessitate the expenditure.

To set rules for thinning is even more difficult than to set rules for pruning. The fruit grower must determine for himself just how much crop the tree will be able to carry. Much depends on the variety, the age of the tree, its vitality, the soil, cultivation, climate, and district. Under equal conditions the Winesap may be thinned to, say, five inches, where the Jonathan would be thinned to six or seven, and the Northern Spy to eight. In climates such as that of Vancouver Island, where no irrigation is available, and the rainfall averages about half an inch per month during the growing season, or one-fifth that of the average Ontario district, all varieties are thinned to a greater distance than in districts of greater rainfall or where irrigation is available. In this district it is advisable to thin many crops, the whole of which could be carried to advantage under other conditions. Unhealthy or diseased trees should not be expected to grow as great a load as those in perfect health, while trees making extensive growth may very well be allowed to carry much more than average trees under the same conditions.

By one rule which is practised to some extent the grower sizes up all the conditions and determines how many boxes of fruit the tree should carry. It is a small matter then to determine how many fruits there should be left on the tree. The results at first are likely to be considerably off the estimate, but this is very largely a matter of practice and variation of seasons.

Another rule which might be taken in conjunction with the previous one is to thin plums to about two and a half, or three inches, peaches four to eight, depending on the earliness of the variety; pears and apples, five to seven inches apart. In thinning pears and apples it is only with early varieties that more than one should be left on any fruit spur, and with these early varieties part of the crop may be removed in one picking, and the balance later.

With Winter varieties of apples it is a good rule to leave fruit only on each alternative spur, to encourage annual bearing. On slender twigs and on wood of the past season's growth (where many varieties bear heavily in British Columbia) it is well to thin to a greater distance than on strong fruit spurs in the body of the tree. On the outside twigs and shoots the fruit will average smaller than on the stouter branches; they are unable to grow a close crop of fruit to perfection.

A very important point, especially with regard to the Yellow Newtown apple, is that the centre apple of the cluster and not one of the side apples should remain. The centre blossom of the cluster comes out first; its stem is usually shorter and stockier than those of the outside blossoms, and at the time of thinning the apple is usually much larger than the others and on a shorter stem. The centre apple usually hangs better to the tree, is the typical apple of the variety, is less liable to variation in shape, and having a shorter stem is better for packing and for appearance's sake.

Fruit spurs vary greatly in size and vitality; the best spurs bear the best fruit; the weaker spurs should be given a chance to develop into strong ones before a next year's crop.

In the production of fancy fruit, thinning pays, and pays well. It means much in the assurance of crops of only higher-class fruit. It is not likely to be of value unless the orchard is right in the matters of variety, fertility, cultivation, pruning and spraying; it is not likely to give good returns unless the high-class article produced is properly packed and marketed by business-like methods. Thinning is an essential feature of the new orchard culture.—R. M. Winslow in Canadian Horticulturist.

A Whitewash for Trees.

Just now is the time for whitewashing the trunks of the orchard trees, to ward off borers and to keep the bark smooth and healthy. A good wash is made from three pounds of the best stone lime, one bar of shaved laundry soap dissolved in a quart of boiling water, and one-half pint of crude carbolic acid.

Place the lime and acid in a pail, and pour over them the dissolved soap. This will start the lime to slaking. Then add small quantities of cold water—not enough to flood the lime, but just to keep it boiling violently until slaking is completed. When slaked, add sufficient water to make about two and one-half gallons of the mixture. The wash should be about the consistency of thick paint. Make up a cheap paint or whitewash brush.

TREATING THE BORERS.

The soil should be removed to a depth of three or four inches at the base of the tree, and an examination made for borers. If the dust-like borings betray them, dig them out with a pocket knife, or thrust a piece of small wire into the burrows and kill them. If the trees are young, the bark of the trunk and larger branches should receive a good rubbing with an old leather mitten, worn on the left hand.

On old trees, the scaly bark should be removed with a tree-scraper. The wash should then be applied to the trunk and larger branches, and the soil replaced about the base.

Another Fruit Pest Threatened.

People on the Pacific coast of the United States have been alarmed by the report of William H. Tidwell, special agent for the United States, that all varieties of fruit in Hawaii are infested with the Egyptian fly, and that unless importation is prohibited California orchards will be infected. The pest makes fruit drop before it ripens.

IT must satisfy you.

If it doesn't, your dealer, backed by us, gladly returns your money.

Isn't that a sincere way to invite you to try it?

THE STANDARD

Remarkable Skimming Records Reported by Eastern Dairy School

CANADIAN Dairymen look upon The Eastern Dairy School at Kingston with great respect, and know that the School's reports are always accurate and reliable. One of this year's reports of the School is of great interest to dairymen as it shows some remarkable skimming records made by The STANDARD Cream Separator.

Test No. 1 (printed on right side of ad) shows that the No. 4 STANDARD, listed at 450 lbs. capacity of milk per hour, skimmed at the rate of over 520 lbs. Not only skimmed at nearly 100 lbs. over its rated capacity, mind you, but skimmed down to .025 per cent., which represents the loss of but 1-4 lb. of butter fat in 1,000 lbs. of milk.

Other makes of separators, skimming at their listed capacity, averave about .10 per cent., which represents the loss of 1 lb. of butter fat in 1,000 lbs. of milk. The STANDARD, skimming at away over its listed capacity, saves 3-4 of a lb. more butter fat in every 1,000 lbs. of milk.

Test No. 1 therefore goes to show that the owner of a STANDARD 450 lb. machine can open it up to skim 550 lbs. and still skim as closely as the next best 450 lb. machine. In other words you can secure a 550 lb. machine at the price of a 450 lb. STANDARD, provided you are satisfied to have the STANDARD skim equally as well as, or better than, other reputed close skimming separators.

Standard

But, if you desire to skim at the rate of .01 per cent. which is equal to a gain in butter fat amounting to $27 per year with a herd of 20 cows, just run the STANDARD at its listed capacity. In fact, in the Eastern Dairy School's tests Nos. 2 and 3, the STANDARD skimmed at .01 per cent. (losing but 1-10 of a pound of butter fat in 1,000 lbs. of milk) and still skimmed considerably over its rated capacity. Truly, the STANDARD is a remarkable machine.

The STANDARD is indeed, "The World's Greatest Separator." And the machine you will select, if you go into the separator-question thoroughly and buy a machine solely on its merits.

Let us send you booklets containing further records of STANDARD tests and proofs of its superiority. Send us your name and address today.

Both Cream and Skim Milk Are Delivered Pure and Clean

GOOD reasons are the basis of all buying. It follows then, that the best buyer is the man who has the best reason, or the most good reasons for buying. When this rule is applied to the purchase of a cream separator and each separator on the market is carefully studied for reasons why it should be chosen, the most careful buyers invest their money in

I H C Cream Separators Dairymaid or Bluebell

Assuming for the sake of argument that the best separators are equal in skimming capacity, simplicity, and durability, there is still one best reason why your choice should fall on an I H C separator. The reason is—the dirt arrester chamber which is found only on I H C separators. More or less foreign matter is very likely to find its way into the milk before it reaches the separator. The I H C dirt arrester chamber removes every particle of this matter before separation begins and holds it imprisoned until the last drop of milk has passed through the bowl. Both your cream and skim milk are delivered pure and clean.

Dirt-arrester chamber with part of side broken away to show how the impurities are collected

There are points in the construction of I H C separators, such as the heavy phosphor bronze bushings, trouble proof neck bearing, cut-away wings, dirt and milk proof spiral gears, etc., which taken in connection with the dirt arrester chamber, make I H C separators beyond any doubt the best of all to buy. There are four convenient sizes of each style. Ask the I H C local agent for demonstration. Get catalogues and full information from him or write nearest branch house.

Salt for Cows.

Some experiments conducted by Professor Babcock, the inventor of the milk tester in Wisconsin regarding the giving and witholding of salt to cows, are of interest to dairy farmers. He found that if salt was absolutely withheld the effect would be seen with some cows in from two or three weeks; but some individuals went on for the most part of a year without any evil effects, but sooner or later the animal developed a state of low vitality, ending in a sudden and complete breakdown, though recovery would be rapid when salt was again given. The effect was worst shown at calving time, or immediately after. In general, cows giving the largest amount of milk were the first to show signs of distress, while there was less trouble while the animals were on the pasture than when in the cowshed. Dry cows suffered very little and the same applies to bullocks and store cattle, the salt naturally in the food or in the "earthlicks" of animals out in the fields being nearly sufficient for them. In an ordinary daily ration there is about three-quarters of an ounce of salt, and this is nearly, but not quite, sufficient for dry stock per head, but not enough for the milch cow. The milk drains away a lot of salt out of the system, and an additional ounce per head daily must be added to the food of a cow indoors. Many years ago the French Government carried out some experiment to test the amount of salt required by the different kinds of farm stock, and reckoned a milch cow required a total of two ounces daily; and this corresponds with Babcock's figure, allowing for differences in the size of different breeds. It is, therefore, safe to say that a milch cow requires about an ounce of salt daily when in milk, besides what she gets in her food. When out of doors the best way is to let her have access to rock salt to lick; but indoors it must be given in the food in the ordinary granular form.

Milk Shorthorns Much Prized.

It is practically an axiom that horses cows or sheep must be kept on every farm to maintain fertility and keep down undesirable vegetable growth. It is also true that every farmer will succeed best with the kind he likes best and that is suited to his farm and location. Cows will not thrive in the same field with sheep, and as few farms are so arranged that the two can be kept separate, it is undesirable to try to keep both sheep and cows on the same farm; at least the cows will not do so well as if they had the farm to themselves.

When a farmer has decided to make cows his money making stock the question arises what breed shall he keep? In the first place no farmer need have two or more breeds of cattle on the same farm. Let him select the breed that suits him best and start in with a pedigreed herd, small or large as circumstances may dictate, or if he cannot afford the pedigreed females use a pedigreed bull on a good cross of the breed desired; then having made his start stay with the breed as long as he farms. There is no great difference among the breeds. Each one fills its own place, and locality to a large degree will determine the breed to be selected. There can be no doubt of the value of the general purpose cow, and as long as iarmers make money breeding them the type will not be abandoned.

A cow that will give a profitable amount of milk and make good beef in time except when she is in flush of milk, is a paying investment for the general farmer; also a farmer wants a regular breeder. It is for these reasons I chose dairy Shorthornsi and I have paid off the mortgage as the result of my choice. All of my cows give upwards of 8000 pounds of milk a year and breed large, healthy calves. In my herd is a two-year-old with a record of 10,395 pounds of milk.

The minute a cow is not wanted in the herd she will bring from $50 to $80 as beef, which makes a considerable item so long as the cow has been up to that time a profitable milker.—Horace W. Avery in New England Homestead.

Choking in Cattle.

This means the lodgement of a foreign obstacle in the esophagus or gullet. It is known by slobbering, distressed breathing and accumulation of gas, which may be noticed on the left side of the paunch.

The proper method of handling an animal thus afflicted is to stand the cow with her head down hill, pressing the head downward as much as possible, while the attendant squeezes as much saliva out of the gullet as possible, then allow her to raise her head and give her one-half pint of raw linseed oil, giving her but one swallow at a time.

If she is not relieved from within 10 to 30 minutes, a half-inch rubber hose six feet long may be pressed gently down the gullet. This will force the obstacle into the stomach, at the same time allowing the gas to escape.

If the animal has been greatly distended by gas before relieved, it may be necessary to give her a laxative and tonic to overcome partial paralysis of the bowels which sometimes follows.

Abortion in Cows.

Editor Maritime Farmer :

Better results are always obtained from a well managed small herd of cattle over that of a mismanaged large herd; in other words, the extra time and attention the stock raiser may take in securing his herd from disease, nets the owner a saving of stock as well as increasing their value.

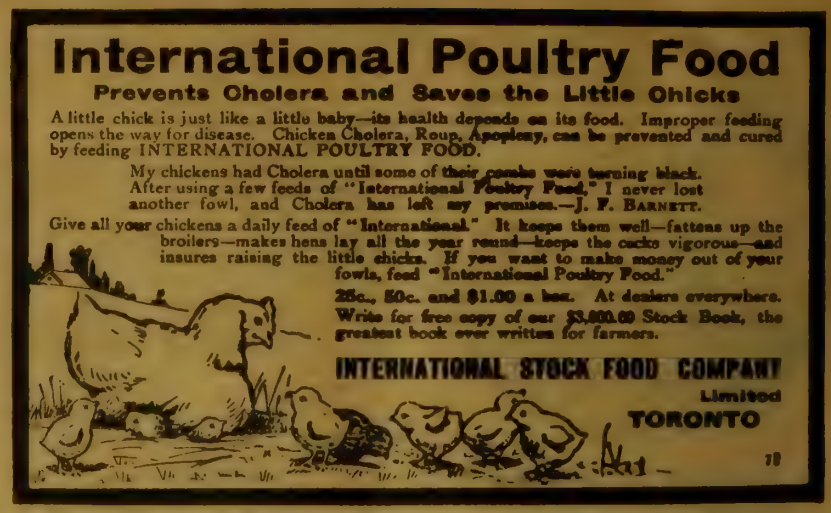
All animals are subject to the germ of disease. The healthier the animal the greater the germ destroying power, but, when a contagious germ is once introduced into a herd, the chances of escape are comparatively small and for this reason the stock raiser is justified in caring for his entire herd, irrespective of their condition of health, and in this way act as a guard in protecting the healthy ones from becoming infected by the germs of the diseased animals.

One of the most important questions which confronts the stock raiser of today is; "How shall we keep our herds in a healthy condition ?"

There is danger in delay. It is never wise to wait for bad results before inspecting your herd as a destroying germ may become embedded in the body and rapidly increase its power of destruction before the oRner observes that his herd is infected with the germs of disease. For this reason it is of a financial benefit to have all animals in the herd inspected, regardless to outward appearances for such diseases as abortion, tuberculosis, etc.

There is no disease among cattle more transmissable than that of abortion as it has been known in numerous instances where whole, healthy herds have become infected in practically a short time from bringing a single animal into the herd affected with this disease.

To substantiate the contagious nature of abortion, a pregnanat cow which has been standing by an animal which aborted was moved to quarters where the disease was unknown and for some time appeared in a healthy condition but later aborted. Unless proper treatment is pursued an animal which aborts for the first time, is a fit subject to abort again, thus rendering her profitless to the owner.—Dr. David Roberts, Wisconsin State Veterinarian.



International Poultry Food
Prevents Cholera and Saves the Little Chicks
A little chick is just like a little baby—its health depends on its food. Improper feeding opens the way for disease. Chicken Cholera, Roup, Apoplexy, can be prevented and cured by feeding INTERNATIONAL POULTRY FOOD.
My chickens had Cholera until some of their combs were turning black. After using a few feeds of "International Poultry Food," I never lost another fowl, and Cholera has left my premises.—J. F. Barnett.
Give all your chickens a daily feed of "International." It keeps them well—fattens up the broilers—makes hens lay all the year round—keeps the cocks vigorous—and insures raising the little chicks. If you want to make money out of your fowls, feed "International Poultry Food."
25c., 50c. and $1.00 a box. At dealers everywhere.

Digestive Disorders in Cattle.

COLIC—BELLY ACHE.

This disorder is neither so common nor so urgent as in the horse. It is not so common, because the intestines of the ox play a less important part in the process of digestion, the more frequent and fatal diseases being, as we have shown, those of the stomachs; and less urgent, because the bovine is capable of withstanding a much greater degree of abdominal pain , has less tendency to inflammation of the bowels, and, from its greater patience, is less likely to complicate matters by doing injury to itself during paroxysms of pain.

As in the horse, colic may be of two forms, spasmodic and flatulent. In the former the symptoms are most severe; in the latter the pain is less acute, but more persistent. It is essential to differentiate between variwties of colic, because they necessarily involve a difference in treatment.

CAUSES.

The passage of food material from the stomachs through the intestinal canal is effected by alternate contraction and relaxation of the muscular coat. When this contraction is irregular we have spasm of the bowel—perhaps only a small portion affected, but sufficient to give rise to acute abdominal pain.

Drinking cold or hard spring water will sometimes produce this; therefore, when the supply has to be drawn from a well, whether by means of windlass or pump, it should stand exposed to the air for some time that its temperature should be raised to that of the atmosphere. Rain water, if sweet, is best for all domesticated animals, and every farm should have efficient means for catching and storing every drop that falls.

Pond water is to be preferred to spring water on account of its greater softness, provided the pond is not in a position in relation to the buildings and yards to receive the drainage from them, which is unfortunately too often the case. If drainings flow into the pond the water is contaminated and rendered unfit for drinking purposes, for liquid manure cannot be considered a fit beverage for animals, and especially for dairy cows; while there is also the loss of valuable manurial constituents which might with advantage be applied to more useful purposes than filling the pond.

Changes of diet are another producing cause of "colicy" pains and these should always be made gradually, and especially in the case of fattening bullocks.

A portion of the old diet should be withdrawn and the new substituted, so that the animal may be gradually accustomed to it.

Flatulent colic is produced, as its name indicates, by the distention of the bowels with gas. It is not of frequent occurrence, tympanic distension being mainly restricted to the rumen.

When it does occur, the cause is probably the passage of improperly prepared food, which, by undergoing fermentation, liberates gas to a larger extent and more rapidly than can be passed off by the usual channel.

Colic may also occur as a result of excessive or morbid secretion of bile, as a feature of constipation, and as a symptom in various kinds of rupture.

Fit Up Your Barn With These Old Reliable Stanchions.
THE farmer of today knows that chains, halters and wooden stalls in the cow barns are expensive, unhealthy, often dangerous makeshifts.
O.K. Canadian U-Bar Steel Stanchions
have replaced them in the modern barns of prosperous farmers. O.K. Canadian Swinging Stanchions are comfortable and easy for cattle—save time in tying cattle—no trouble to latch and unlatch—strong enough to stand rough usage. Used by the leading farmers and stockmen for years—because the best and most satisfactory stanchion on the market.
5 sizes—write for new catalogue.
Canadian Potato Machinery Co., Limited, - Galt, Ont.

SYMPTOMS.

An attack of colic may be sudden or gradual. In the latter there are premonitory symptoms of uneasiness for which the stockman is unable to account, and the animal stops feeding and rumination is suspended.

When the attack is sudden or acute there is no mistaking the locality of the pain, for the animal stamps its feet and kicks at its belly, moans, grinds its teeth, looks around in the direction of the seat of pain, and frequently passes small quantities of urine. There are intervals of ease during which the animal appears quite comfortable until the spasm comes on again.

When due to flatulence, the pain is not so severe, but the intervals of ease are not so frequent. Gaseous eructation and the passing of wind per anum, with more or less swelling or distension on the right side of the abdomen, help to distinguish flatulent from spasmodic colic.

As a result of colic, there sometimes occurs intussusception— a condition where during spasm one uart of the bowel is drawm into another— and volvulus, or twisting of the intestine, either of which, of course, produce complete obstruction and give rise to inflammation.

These may result from the struggles of the animal during its paroxysms of pain, the displacement being rendered still more easy by the contraction or reverse peristalsis, and the distension of the bowels with gas.

TREATMENT.

To prevent either disaster resulting, it is necessary that treatment should be prompt. The indications are to relieve the pain and obtain a free evacuation of the contents of the bowels. The latter tends to remove the cause, and the administration of a cathartic is not open to the objections urged against such a course in the treatment of colic in the horse.

To relieve the pain opium is most valuable, and this drug in the shape of laudanum (tincture of opium) should find a place in the Materia medica of every stockowner. Chlorodyne is now preferred by some, but a bottle containing laudanum is more commonly kept at hand for use in cases of emergency.

An example of a drench for colic in cattle is:—Laudanum, 1 oz.; sweet spirit of nitre, 1 oz.; powdered ginger ½ oz.; Epsom salts, 2 oz., in a quart of warm ale. If the pains are due to flatulence ammonia should be added to the drench, preferably in the shape of 2 ozs. of spirit of sal volatile.

Walk the animal gently round a yard or roomy box, and rub the abdomen with a wisp of hay or straw, or with the palm of the hand and a little stimulating liniament, or with thin mustard and water.

In colic, pressure and rubbing of the abdomen give relief.

Very often the above dose is sufficient to relieve the pain, and further treatment is unnecessary, but if the paroxysms continue the opium and antispasmodics must be repeated, substituting linseed oil in doses of half a pint for the Epsom salts. Copious enemas of warm soapy water are most useful.

If ammonia, spirits of sal volatile, and sweet nitre are not at hand, turpentine in 2 oz. doses, essence of peppermint, gin, pepper, or cloves may be tried, but there is nothing that can efficiently replace the laudanum.

There is great difficulty, even for experienced men, in determining the occurrence of the complication of intussusception and volvulus; in fact, they are only to be assured from the pain becoming more severe, and the intervals of ease less frequent, or from the attack not yielding to treatment. —M. C. R. V. S., in Mark Lane Express.

Both A
Bread Flour
And A
Pastry Flour

"A woman always wants a reason, but never gives one".

So we are going to tell you just why **"Beaver" Flour** is a bread flour and a pastry flour —as good for one as for the other—*and best for both.*

Ontario Fall Wheat is the most nutritious wheat in the world — rich in flesh and strength building qualities and with a full rich flavor and splendid pastry making qualities.

Manitoba Spring Wheat has more strength than Ontario Fall Wheat—but is not so good for pastry.

Naturally, *the perfect flour* is the one that combines the good qualities of *both* Ontario and Manitoba wheat. *This is exactly what* **"Beaver" Flour** *does.* It is a *blend* of Ontario Fall Wheat and Western Spring Wheat. It contains *exact quantities of each.* **"Beaver" Flour** has the real home made flavor that a Western Wheat flour lacks—it makes deliciously light, tasty Cakes, Pies and Fancy Pastry.

135

Order "Beaver" Flour

for your next baking day. Put it to the test. Try it for *both* Bread and Pastry—and see for yourself the convenience and economy of using a true blended Flour. Dealers—Write us for prices on Feed, Coarse Grains and Cereals.

THE HORSE.

Night Watering of Horses.

"A horse comes in hungry, and he wants his supper so much that he will drink but little, and he ought not to drink deeply at that time, even if he wanted to,'. was the way a stableman put his ideas on watering before feeding in the evening. "Then he eats a quantity of dry, heating food. He shouldn't have water right after eating; but if he doesn't get a good drink two or three hours later, he will go through the night thirsty, and the heating food will burn out his insides for the lack of the water that is needed to give the nourishment of the food a chance to do the good work it ought to be doing." Moreover, a horse not watered at night is very apt to drink too much in the morning.

This night-watering is not only common humanity in hot weather, but it is almost equally valuable in winter. For appetite comes with the bracing effect of cold weather, and horses eat more than they do in summer. Consequently, if this extra food is to do its part in giving the horse power to resist the cold and the strain of the winter work, water must be given at the time when it will do the most good. Nothing does so much towards giving back a return ,or the food given in the way of extra strength, working endurance and good condition.

The effect of this night-watering in the blood and general circulation is far-reaching. The thirst that follows the digestion of a meal is the call of nature for the water that is needed to help the good of the food to get into the flesh and blood of the animal; and equally important is the part played by the water in sending the waste matter out of the body with the least possible wear and tear on the organs that perform this indispensable duty. A horse that remains thirsty all night cannot be expected to last as long as one that is watered at the proper time. A distinguished veterinary surgeon recently remarked: "Going too long without water causes more colic in horses than anything else does."— The Homestead.

Judging Brood Mares.

The question of judging brood mares has come very much to the front of late, and there seems a good deal to be said in favor of a contention that I have heard of more than once at the ring side. It is to the effect that sufficient notice is not taken of the foal when the brood mare classes are before the judges. In a case which took place within the last few weeks the merits of two brood mares seemed pretty evenly balanced. There was little between them on points, but the foal of the mare which took second prize stood out a long way in front of that of the winner. In a word the superior breeding of one mare showed itself emphatically in her foal. It was argued, and I think with reason, that, as the sole use of a brood mare, as a brood mare, is the quality of the foals she breeds, in this case the second prize mare should have been placed second. Against this standpoint, it was argued that you must take the mares as you see them; and it was asked what was to be done with a mare that was herself "nothing very wonderful to look at, and thatunder ordinary circumstances would stand fifth or sixth in her class, suppose she had a foal that was a long way the best in the class?" Well, if the foal stood out a long way in front, I should put her first, for she has fulfilled the first requirements of a brood mare. That it would add considerably to the labors of the judges, at any rate at first, if such a plan were adopted I have no doubt, for it is not often that any foal stands out so pre-eminently as I have indicated. But I am sure the principle is a sound one.

Let me put the argument another way, or rather let me give an illustration of it from another standpoint. Many years ago I knew a brood mare that made a great reputation. She was a big, fine mare, full of quality with good bone, and she was an exceptionally good mover. Wherever she went Bess—let us call her Bess, it was not her name— was a winner. It is many years since, and memory is apt to play us funny tricks after a lapse of time, but I can only remember two occasions on which she was not a winner, and she was certainly a nice little annuity for several years to her lucky owner. But (and it is a very big "but") she never bred him a foal worth the proverbial glass of gin, and I do not remember any of her foals being shown in a separate class for foals. I am quite certain none of them ever won anything. Not so many years ago I had occasion to look this mare's history up, and so I am sure of my facts. Now, in this case two facts present themselves; first, this mare secondly, if she was not a good brood was not a good brood mare, and, mare she should not have cleared the board as she did. Then another question perhaps needs a word of discussion. Why was she such a bad breeder? I have no hesitation in saying that it was because she had a bad cross in her somewhere—that her pedigree was faulty. As I have said, she was a big, fine mare. I do not remember to have seen a single foal from her, and I can safely say I saw them all, which was not undersized and weedy.

Green Oats for Horses.

Some feeders can winter horses on hay and straw alone when they are not working and start them in with a grain ration only a few days before hard work begins. There is a little secret here for those who do not know the knack. It is in the hay. Hay that is cut early enough to have all the juice in it when cured will carry animals through well if it was cured properly. Hay that was dead ripe when cut is too woody to have much of its feeding value. Horses that come through the season's work in good condition can be carried through the winter on the right kind of hay and straw. A few bundles of oats cut green will help out this rough ration wonderfully during the coldest weather.

Heaves.

J. B., N. S.—We have a horse which is badly wind broken. Is there any remedy, and if not what can we give him to ease him so we can work him?

Ans.—The disease is incurable and it would be well if you could trade the horse back to the dealer. But there is no resourse. A written guarantee always should be demanded when buying from a stranger; but it is best not to buy a horse from anyone you do not know and trust. Feed grass alone in summer and wetted oat straw or oat hay and a little silage in winter. Oats and bran may be fed when work has to be done. Do not feed any bulky feed at noon and do not work the horse soon after a meal. Give the drinking water before feeding. Give half an ounce of Fowler's solution of arsenic night and morning, after afew smaller preliminary doses.

Care of the Horse.

In grooming curry him every way.

Scrape off all bot fly eggs with a knife.

Leave him his forelock, mane and tail, but trim them if necessary.

Dry your horses feet at night, wash them in the morning.

See that no nails get in his feet.

In harnessing, keep the backband back from the withers.

Shoe your horse regularly, but do not allow the blacksmith to rasp off the outer edge of the hoof, which should act as varnish does on a pine knot.

To prevent the shoulders of a green horse from scalding, raise his collar periodically and thoroughly dry his shoulders.

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Cholic, Cholera and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an exvellent remedy, and takes pleasure in recommending it. For sale by all dealers.

Horsemen Attention!

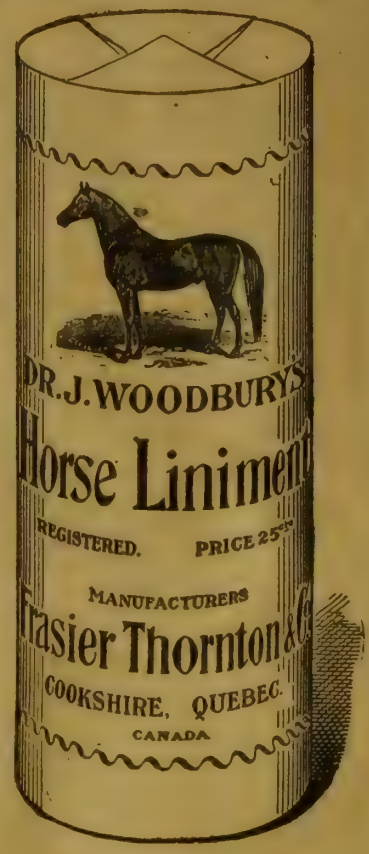
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distempr, Glanders, Spavins, Pink Ey, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

POULTRY.

Frozen and Dried Eggs.

Frozen and dried eggs intended for human consumption are largely used for cooking purposes where inferiority may be concealed, as in baking cakes or making custards, omelets, pies, etc. The traffic in eggs sold for drying and freezing has greatly increased in the past few years. Strictly fresh marketable eggs in the shell command a high price and there is difficulty in meeting the demand for them; but large quantities of questionable eggs, often bought at vert low prices, have been broken out for cooking purposes by disreputable firms, being preserved by freezing or drying until ready for use. Some dealers, howcever, maufacture a satisfactory product by the use of good eggs handled under proper conditions.

There is no objection to drying or freezing good eggs under proper sanitary conditions; in fact, there are some advantages to be gained by preserving eggs in this manner, although the manufacturing processes devised by man, as a rule, do not improve the quality of nature's work. Conditions of modern life and commerce must, however, be met, and dried eggs or eggs in a frozen condition may be shipped long distances and require less space for transportation and storage than do eggs in the shell.

As the result of investigations instituted by Secretary Wilson, the United States department of agriculture has recently issued two publications that give practical suggestions for correcting some of the existing practices and conditions which are at least partially responsible for the unsatisfactory products now found on the market. These publications are Bulletins 158 and Circular 98 of the Bureau of Chemistry, entitled, respectively, "A Bacteriological Study of Shell, Frozen and Dessicated Eggs", and "Practical Suggestions for the Preparation of Frozen and Dried Eggs."

Dr. Morse's Indian Root Pills

exactly meet the need which so often arises in every family for a medicine to open up and regulate the bowels. Not only are they effective in all cases of Constipation, but they help greatly in breaking up a Cold or La Grippe by cleaning out the system and purifying the blood. In the same way they relieve or cure Biliousness, Indigestion, Sick Headaches, Rheumatism and other common ailments. In the fullest sense of the words Dr. Morse's Indian Root Pills are 47

A Household Remedy

Diseases of Poultry.

As this is the season of the year when that most dreaded and contagious of diseases among poultry is liable to attack them, it may not be out of place to caution the readers of the Poultry Department of this journal to keep a sharp lookout for any symptoms of roup which may make their appearance at any time.

The treatment of poultry diseases should seldom concern the farmer or the up-to-date poultryman. If the healthiest and most vigorous breeding fowls are kept, the chickens reared under the most satisfactory conditions, fed on wholesome food and not over-crowded and the runs and buildings kept thoroughly clean and disinfected, there will rarely be disease among them. When disease does appear it will usually be found more satisfactory to kill and bury the sick birds than to treat the disease.

The poultry houses should be thoroughly cleaned out and disinfected by the use of a good application of chloride of lime or slacked lime reduced very thin with boiling water, to which has been added some carbolic acid or coal oil, and with a good whitewash brush or spray pump cover every inside inch of the building, including roof, walls, roosts, nest boxes, etc., with the hot mixture.

The poultry yards, if situated so they cannot be plowed and cropped, should be treated with unslacked lime dust. Scrape the yards clean of manure and refuse, scatter the lime thick on the ground, then sprinkle the lime with water, which will cause it to become slacked and cause it to destroy any germs of parasites in the soil.

Roup is the result of damp, cold and draughty houses, and attacks the fowls in various ways. The most reliable symptom is noticed while the fowl is at roost, and consists of a rattling noise which sounds like water thrown on coals of fire. The noise is caused by the fowl breathing through the windpipe and nostrils, which have become clogged. A most offensive odor is also noticed and a discharge at the nostril starts, which in a few days becomes hardened, so that the fowl can only breath through the mouth. In other cases the rattling only is noticed and no discharge at the nose. One of the surest methods is to see if the odor is present, and to examine the roof of the mouth where in nearly all cases of roup a yellow, offensive deposit is noticed.

Roup is one of the highly contagious diseases and is mostly communicated to healthy birds through the medium of the drinking trough. One sick bird will by this means infect a whole flock. The disease is easily recognized, as the bird's head swells and a foul discharge proceeds from the eyes and nostrils. When the disease has great headway it is safest to kill the bird, because a disgusting fungus has grown in the throat which has given rise to the term "diphtheric roup." It is then very dangerous and is communicable to children.

The treatment should be isolation of the affected birds, disinfect all of their roosts, nests and houses, destroy or at least thoroughly cleanse with a disinfecting fluid all drinking and feeding utensils, and for some time afterwards add a little Stockholm tar to the drinking water. Bathe the head of the affected bird frequently with warm water into which has been put a little bluestone sufficient to turn the water a pale blue, and use a syringe to clean the nostrils and throat with the same solution. Do not allow the bird to swallow any quantity of it as it is poison. When the symptams of roup is first noticed give the bird a dose of Epson salts. The only certain way to prevemt the re-appearance of the disease is to kill the affected birds and thoroughly cleanse and disinfect the houses and runs.

Another cure is to take a small quantity of glycerine and put into it a couple of drops of essence of wintergreen and pour this into the fowls nostrils and throat, and is also a good mixture to use on the head and eyes of roupy birds. Be sure and treat the disease at once. Plenty of charcoal and grit is a great preventative, but above all have suitable quarters for the birds.

Any Man May Easily Regain LOST VITALITY

Strong vigorous vitality, the crowning glory of mature, healthy manhood.

Do you know, reader, what this means to you?

If by these few simple inspired words which every man may with profit read) I should be the means of pointing out to you or other men the straight and sure, if narrow road to new manhood, new powers, new capacities for a better and more glorious physical and vital development, then in doing this I have rendered a great and lasting service to my fellow beings, and one which is infinite in its power for good.

This self-same VITALITY, this builder of manhood and manly vigor, may easily be regained, and I will tell you how.

Have you ever stopped to consider that it is this VITAL FORCE which makes rugged men the real men that they are? It is this same MAN FORCE which is behind every great achievement in the world to-day, which gives the flower of our army and navy the courage to meet and face death unflinchingly, which gives the rough and rugged man of the plains that compelling power to rescue at all odds a loved one from some great peril, as our illustration here portrays, and it is this self-same, identical VITAL VIGOR which I must impart to you, reader, if you are not the man you should be.

Therefore, if I give you new vitality, I make you young again, and keep you feeling young the balance of your days. By increasing your vital supply, I soon have you answering "Simply feeling fine" to your friends' morning greetings, while they in their turn will secretly marvel at the wonderous change for the better which has come over you. A thoroughly vital, manly man is the greatest inspiration in the world; his power and fascination are felt by all women and all men alike who are near him. Nothing but death can conquer the giant of strength and manly vigor. On the other hand, how different with the half-man, the neurasthenic degenerate, who is burning up his vitality in dissipation and excesses! Is there any sight more pitiable, more repellent to one's sense of decency, then the weakling who deliberately kills his manhood and self-respect by acts of willful debauchery? Such a man has neither my sympathy nor can he profit by what of wisdom I can impart. But any man who is willing to make a fair, square fight for the return of his lost vitality and lost manhood, who will promise faithfully and honestly to discontinue any debasing practices or excesses he may be indulging, who will help me thus by helping himself to such, no matter how despondent he may be, no matter how weak and debilitated, no matter what years of folly have passed, to such a man I can offer all the encouragement in the world. Just lead a decent man's life, my friend, and then increase your VITALITY. All else will come.

I make and distribute a vitalizing appliance which I call a HEALTH BELT. I do not want you to get one of there HEALTH BELTS now nor to-morrow nor next week, for that matter, but first wish you to write for or call and get one of my little free books. I want you to thus have my whole story of this subject of VITALITY, so that you may judge for yourself. My HEALTH BELT, with suspensory attachment, is a complete treatment in itself; that is you place it comfortably around your waist nights when you go to bed and wear it at the time when you are asleep. The vitality which it produces and sends into your system hour after hour is felt as it flows in. There is no shock, but merely a pleasant, warm, soothing sensation which induces a sound, refreshing sleep. Weak back often disappears at once, and a better feeling is immediately experienced. Two or three months' wear is usually sufficient. The cost is nominal. With special attachments, my HEALTH BELT is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain, sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call to-day. Hours 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

NAME

ADDRESS

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

MEMORIES.

I still seem to hear through distant years,
A voice that has long since been stilled;
And I seem to hear through a vale of tears
Her prayer for a son wayward willed.

As I onward went, on self-pleasure bent,
I can yet hear my mother pleading,
For me to leave the vice and sins of the world,
And abide where God is leading.

...

But no, not so. I have waited too long;
The voice of my mother has fled.
No more on earth shall I hear her song,
For she's numbered now with the dead.

O brother mine be up and away,
Make haste to reach peace today.
The time is so short we are here to stay,
Tomorrow may be too late.

Don't let it be said, too late, too late,
To comfort your dear mother's heart;
Don't let it be said "too late too late,"
To do a son's noble part.

So soon will the call come to you and to me,
To lay all our burdens aside,
And may it be said we were ready to go
And with Him who is perfect abide.

When all the lessons of life have been learned,
And its pagens forever are closed,
The love that here has been cruelly spurned
Will triumph forever in heaven.

And if we could push ajar the gates of life,
And stand within, and all God's workings see,
We then could understand the doubt and strife,
And for each mystery could find a key.

—Esther Moore.

David Copperfield.

By Charles Dickens.

CHAPTER 1.

I Am Born.

Whether I shall turn out to be the hero of my own life, or whether that station will be held by any one else, these pages must show. To begin my life with the beginning of my life, I record that I was born (as I have been informed and believed) on a Friday, at twelve o'clock at night. It was remarked that the clock began to strike, and I began to cry, simultaneously.

In consideration of the day and hour of my birth, it was declared by the nurse, and by some sage women in the neighborhood who had taken a lively interest in me several months before there was any possibility of our becoming personally acquainted, first, that I was destined to be unlucky in life; and secondly, that I was priviliged to see ghosts and spirits, both these gifts inevitabiy attaching, as they believed, to all unlucky infants of either gender, born towards the small hours on a Friday night.

I need say nothing here on the first head, because nothing can show better than my history whether that prediction was verified or falsified by the result. On the second branch of the question, I will only remark, that unless I ran through that part of my inheritance while I was still a baby, I have not come into it yet. But I do not at all complain of having been kept out of this property; and if anybody else should be in the present enjoyment of it, he is heartily welcome to keep it.

I was born with a caul, which was advertised for sale, in the newspapers, at the low price of fiifteen guineas. Whether sea-going people were short of money about that time, that there was but one solitary bidding, and that was form an attorney connected with the bill-broking business, who offered two pounds in cash, and the balance in sherry, but declined to be guaranteed from drowning on any higher bargain. Consequently the advertisement was drawn at a dead loss—for as to sherry, my poor dear mother's sherry was in the market then—and ten years afterwards the caul was put up in a raffle down in our part of the country, to fifty members at half-a-crown a head, the winner to spend five shillings. I was present myself, and I remember to have felt quite uncomfortable and confused, at a part of myself being disposed of in that way. The caul was won, I recollect, by an old lady with a hand-basket, who, very reluctantly, produced from it the stipulated five shillings, all in halfpence, and twopence halfpenny short—as it took an immense time and a great waste of arithmetic, to endeavour without any effect to prove to her. It is a fact which will long be remembered as remarkable down there, that she was never drowned, but died triumphantly in bed, at ninety-two. I have understood that it was, to the last, her proudest boast, that she had never been on the water in her life, except upon a bridge; and that over her tea (to which she was extremely partial) she, to the last, expressed her indignation at the impiety of mariners and others, who had the presumption to go "meandering" about the world. It was in vain to represent to her that some conveniences, tea perhaps included, resulted from this objectionable practice. She always returned, with greater emphasis and with an instinctive knowledge of the strength of her objection, "Let us have no meandering."

Not to meander myself, at present, I will go back to my birth.

I was born at Blunderstone, in Suffolk, or "thereby" as they say in Scotland, I was a posthumous child. My father's eyes had closed upon the light of this world six months, when mine opened upon it. There is something strange to me, even now, in the reflection that he never saw me: and something stranger yet in the shadowy remembrance that I have of my first childish association with his white grave-stone in the churchyard, and of the indefinable compassion I used to feel for it lying out there alone in the dark night, when our little parlor was warm and bright with fire and candle, and the doors of our house were—almost cruelly, it seemed to me sometimes—bolted and locked against it.

An aunt of my fathers, and consequently a great aunt of mine, of whom I shall have more to rolate by and by, was the principal magnate of our family. Miss Troiwood, or Miss Betsy, as my poor mother always called her, when she sufficiently overcame her dread of this important personage to mention her at all (which was seldom), had been married to a husband younger than herself, who was very handsome, except in the sense of the homely adage, "handsome is, as handsome does,"—for he was strongly suspected of having beaten Miss Betsy, and even of having once, on a disputed question of supplies, made some hasty but determined arrangements to throw her out of a two pair of stairs' window. These evidences of an incompatibility of temper induced Miss Betsy to pay him off, and effect a separation by mutual consent. He went to India with his capital, and there, according to a wild legend in our family, he was once seen riding on an elephant, in company with a Baboon; but I think it must have been a baboo—or a Begum. Anyhow, from India tidings of his death reached home, within ten years. How they affected my aunt, nobody knew; for immediately upon the separation she took her maiden name again, bought a cottage in a hamlet on the sea-coast a long way off, established herself there as a single women with one servant, and was understood to live secluded, ever afterwards, in an inflexible retirement.

My father had once been a favorite of hers, I believe; but she was mortally affronted by his marriage, on the ground that my mother was "a wax doll." She had never seen my mother, but she knew her to be not yet twenty. My father and Miss Betsy never met again. He was double my mother's age when he married, and of but a delicate constitution. He died a year afterwards, and, as I have said, six months before I came into the world.

This was the state of matters on the afternoon of, what I may be excused for calling, that eventful and important Friday. I can make no claim, therefore, to have known, at that time, how matters stood; or to have any remembrance, founded on the evidence of my own senses, of what follows.

My mother was sitting by the fire, but poorly in health, and very low in spirits, looking at it through her tears, and desponding heavily about herself and the fatherless little stranger, who was already welcomed by some grosses of prophetic pins in a drawer upstairs, to a world not at all excited on a subject of his arrival; my mother, I say, was sitting by the fire, that bright, windy March afternoon, very timid and sad,' and very doubtful of ever coming alive out of the trial that was before her, when, lifting her eyes as she dried them, to the window opposite, she saw a strange lady coming up the garden.

My mother had a sure foreboding at the second glance, that it was Miss Betsy. The setting sun was glowing on the strange lady, over the garden fence, and she came walking up to the door with a fell rigidity of figure and composure of countenance that could have belonged to nobody else.

When she reached the house she gave another proof of her identity. My father had often hinted that she seldom conducted herself like any ordinary Christian; and now, instead of ringing the bell, she came and looked in at that identical window,

MOTHERHOOD SUGGESTIONS

Advice to Expectant Mothers

The experience of Motherhood is a trying one to most women and marks distinctly an epoch in their lives. Not one woman in a hundred is prepared or understands how to properly care for herself. Of course nearly every woman nowadays has medical treatment at such times, but many approach the experience with an organism unfitted for the trial of strength, and when it is over her system has received a shock from which it is hard to recover. Following right upon this comes the nervous strain of caring for the child, and a distinct change in the mother results.

There is nothing more charming than a happy and healthy mother of children, and indeed child-birth under the right conditions need be no hazard to health or beauty. The unexplainable thing is that, with all the evidence of shattered nerves and broken health resulting from an unprepared condition, and with ample time in which to prepare, women will persist in going blindly to the trial.

Every woman at this time should rely upon Lydia E. Pinkham's Vegetable Compound, a most valuable tonic and invigorator of the female organism.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal, healthy and strong.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

CHALLENGE COLLARS

Are a boon to every man who cares for his personal appearance.

Challenge Collars are not shiny rubber collars. They have a dull linen finish. In fact, you can't tell them from linen. Keep up appearances—keep down laundry bills.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. Dr. de Van's are sold at $5 a box, or three for $10. Mailed to any address. The Scobell Drug Co., St. Catharines, Ont.

pressing the end of her nose to the glass to that extent that my poor dear mother used to say that it became perfectly flat and white in a moment.

She gave my mother such a turn, that I have always been convinced I am indebted to Miss Betsy for having been born on a Friday.

My mother had left her chair in her agitation, and gone behind it in the corner. Miss Betsy, looking around the room, slowly and inquiringly, began on the other side, and carried her eyes on, like a Saracen's head in a Dutch clock, until they reached my mother. Then she made a frown and a gesture to my mother, like one who was accustomed to be obeyed, to come and open the door. My Mother went.

"Mrs. David Copperfield, I think?" said Miss Betsy; the emphasis referring, perhaps, to my mother's mourning weeds, and her condition.

"Yes," said my mother, faintly,

"Miss Trotwood," said the visitor. "You have heard of her, I dare say?"

My mother answered that she had had that pleasure. And she had a disagreeable consciousness of not appearing to imply that it had been an overpowering pleasure.

"Now you see her," said Miss Betsy. My mother bent her head, and begged her to walk in.

They went into the parlor my mother had come from, the fire in the best room on the other side of the passage not being lighted—not having been lighted, indeed, since my father's funeral; and when they were both seated, and Miss Betsy said nothing, my mother, after vainly trying to restrain herself began to cry.

"Oh tut, tut, tut!" said Miss Betsy, in a hurry. "Don't do that! Come, come!"

My mother couldn't help it notwithstanding, so she cried until she had her cry out.

"Take off your cap, child," said Miss Betsy, "and let me see you."

My mother was too much afraid of her to refuse compliance with this odd request, if she had any disposition to do so. Therefore she did as she was told, and did it with such nervous hands that her hair(which was luxuriant and beautiful) fell all about her face.

"Why, bless my heart!" exclaimed Miss Betsy. "You are a very baby!"

My mother was, no doubt, unusually youthful in appearance even for her years; she hung her head, as if it sobbing, that indeed she was afraid were her fault, poor thing, and said, she was but a childish widow, and would be but a childish mother if she lived. In a short pause which ensued, she had a fancy that she felt Miss Betsy touch her hair, and that with no ungentle hand; but, looking at her, in her timid hope, she found that lady sitting with the skirt of her dress tuckd up, her hands folded on one knee, her feet upon the fender, frowning at the fire.

"In the name of Heaven," said Miss Betsy, suddenly, "why Rookery?"

"Do you mean the house, ma'am?" asked my mother.

"Why Rookery?" said Miss Betsy. "Cookery would have been more to the purpose, if you had any practical ideas of life, either of you."

"That name was Mr. Copperfield's choice," returned my mother. "When he bought the house, he liked to think there were rooks about it."

The evening wind made such a disturbance just now, among some tall old elm trees at the bottom of the garden, that neither my mother nor Miss Betsy could forbear glancing that way. As the elms bent to one another, like giants who were whispering secrets, and after a few seconds of such repose, fell into a violent flurry, tossing their wild arms about, as if their late confidences were really too wicked for their peace of mind, some weather-beaten ragged old rook's nests burdening their higher branches, swung like wrecks upon a stormy sea.

"Where are the birds?" asked Miss Betsy.

"The—?" My mother had been thinking of something else.

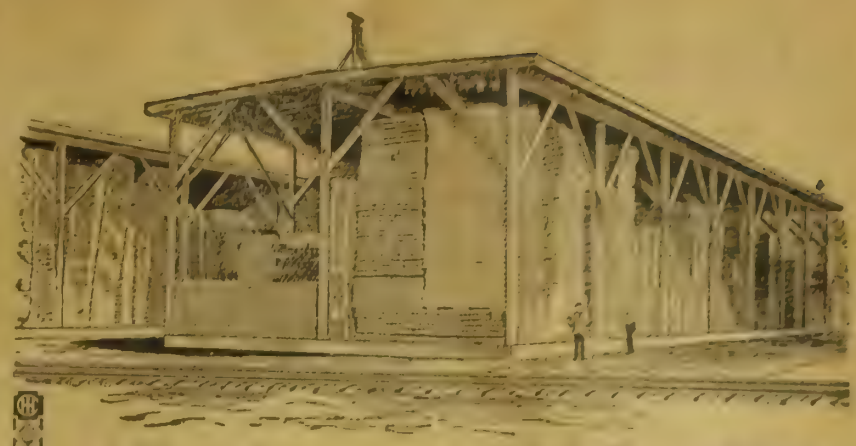
"The rooks—what has become of them?" asked Miss Betsy.

"There have not been any since we lived here," said my mother. "We thought—Mr Copperfie'd thought— it was quite a large rookery; but the nests were very old ones, and the birds have deserted them a long while."

"David Copperfield all over!" cried Miss Betsy. "David Copperfield from head to foot! Calls a house a rookery when there's not a rook near it, and takes the birds on trust, because he sees the nests!"

"Mr Copperfield," returned my mother, "is dead, and if you dare to speak unkindly of him to me—"

My poor dear mother, I suppose,



A Plain Statement of I H C Wagon Value

THERE is money saved for one farmer every time an I H C wagon is sold. Not because it costs less money to begin with, but because of the length of service it gives, an I H C wagon is the cheapest wagon you can buy. A new wagon costs you the price of so many bushels of wheat or oats, or so many bales of hay. The longer the wagon lasts the more you get for the original purchase price, and the cheaper your wagon becomes. That is why it is economy to buy the best wagon—one that will outlast any ordinary wagon. When you buy an I H C wagon

Petrolia Chatham

you invest in a wagon built of the highest grade material which experience and care can select or money can buy; built in the most thorough, painstaking manner, by skilled workmen, in factories which have modern appliances for doing work of the highest standard at the lowest possible cost. The conditions under which I H C wagons are built are nearly ideal.

All lumber used is air-dried in sheds with concrete floors. This insures toughness and resiliency. All metal parts are made of especially prepared steel, guaranteeing the longest service. Each wagon undergoes four inspections before being shipped so that it reaches the purchaser in first class condition, ready to be put to work at once and able to carry any reasonable load over any road where a wagon should go.

The I H C local agent knows which wagon is best suited to your work, will tell you why, and will sell you that one. When you see him have him show you all the good points of I H C wagons, and hear what he can tell you about the experiences of I H C wagon owners. You can get literature from him, or write the nearest branch house.

DOMINION WATCH CO., MONTREAL, CANADA DEPT. No. 10

"Cholera Infantum"

THE SUMMER COMPLAINT OF INFANTS

Cholera infantum begins with a profuse diarrhœa, the stomach becomes irritated, and in many cases vomiting and purging set in. The child rapidly loses flesh, and is soon reduced to great langour and prostration.

Cholera infantum can be quickly cured by the use of Dr. Fowler's Extract of Wild Strawberry. Mrs. David A. Cleveland, Apple River, N.S., writes:—"Last September my little boy, four years old, and little girl, two years old, were taken one afternoon with vomiting spells, and in a few hours they had cholera infantum. I had Dr. Fowler's Extract of Wild Strawberry in the house, and commenced using it. The cholera got so bad the next day, they passed nothing but blood. I kept on using the medicine, and in a few days they were cured. I always keep a bottle in the house, as I don't think there is anything better for summer complaint than Dr. Fowler's Extract of Wild Strawberry."

Some dealers may try to sell you something else, but for the good of your child's health, insist on having "Dr. Fowler's." It has been on the market for over sixty-five years, so you are not using a new and untried remedy. Price 35 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

had some momentary intention of committing an assault and battery upon my aunt, who could easily have settled her with one hand, even if my mother had been in far better training for such an encounter than she was that evening. But it passed with the action of rising from her chair, and she sat down again very meekly, and fainted.

When she came to herself, or when Miss Betsy had restored her, whichever it was, she found the latter standing at the window. The twilight was by this time shading down into darkness; and dimly as they saw each other, they could not have done that without the aid of the fire.

"Well?" said Miss Betsy, coming back to her chair, as if she had only been taking a casual look at the prospect; "and when do you expect—"

(To be continued.)

Fall Excursions to Montreal.

Montreal is always a city of interest, and especially so in early Autumn, when the weather is enjoyable the many stores crowded with seasonable novelties, and the places of amusement in fall swing. A visit there at this time of year cannot be otherwise than enjoyable, and with the very low rate prevailing on the Intercolonial Railway in connection with the Fall Excursions, the round trip can be made more cheaply than at any other time. On Sept. 12, 13 and 14 the round trip fare from St. John will be only $12.00, tickets good for return Sept. 30th. On Sept. 26, 27 and 28 the same rates will prevail with the return limit Oct. 14th. Travellers from the Maritime Provinces have the choice of two of the finest through trains on the continent the Ocean Limited and the Maritime Express, both renowned for the excellence of their sleeping and dining car service.

Flour and Breadmaking.

(Continued from last issue)

BREADMAKING.

The object of the miller is to make all the flour that is possible from the wheat at his disposal and to separate this into the grades demanded by his customers. The baker's part is to make from the flour the maximum amount of bread of a good quality. To do this intelligently, he should not only be familair with the methods of manipulation, but he should also understand the nature of the materials he is working with, and, so far as is possible, the chemical and physical changes brought about during the process.

We have dealt with flour and it now remains for us to discuss some of the more important leavening materials and the changes which these and other agencies cause in the dough.

LEAVENING MATERIALS.

YEAST.

Yeasts are the natural agents which cause the fermentation of bread dough, familiar to every housewife as "raising." This fermentation of bread has been known as long as we have any recorded history, for early bible writers tell of leavened and unleavened bread, the former being raised with leaven (which we now know was yeast), and the latter being baked without previous raising. Although this phenomenon of the fermentation of bread was thus known from very early times, its real cause was not definitely proven until the last century, when between the years of 1830 and 1860 German and French scientists showed that different fermentations were caused by living organisms, and among these was the yeast organism, or, as it is commonly called, the yeast plant. Yeasts are also active in a number of other fermentations, viz., the brewing of beers, ales and wines, either commercial or home-made, the making of vinegar, the "spoiling" of canned fruit, and production of gassy curd in cheesemaking, etc.

Yeast plants are always microscopic no species being large enough to be seen with the naked eye. The individual yeast plants average only 1-3000 of an inch in diameter, hence to see them at all requires a very powerful microscope. Yeast as seen with the naked eye, in a yeast cake or otherwise, is made up of a mass of individual yeast cells or plants. If a bit of yeast is mixed with water, and examined under a high-power lens, there will be seen great numbers of cells such as shown in Fig.7, some nearly spherical, some oval, and some even quite elongated. They are colourless as seen under the microscope, although in masses they appear of a creamy white colour. The outline or cell wall is regularly and sharply defined. The contents of the cell usually shows one and sometimes two or more rounded clear spots, called vacuoles, and a number of small fat drops besides the slightly granular protoplasm which makes up the remainder of the cell contents.

When a bit of yeast is placed in a solution which contains the proper food, the yeast cells immediately begin to consume the food and grow and multiply by the method known as budding. Upon the side of the cell appears a small swelling or bud. This little bud increases in size until final

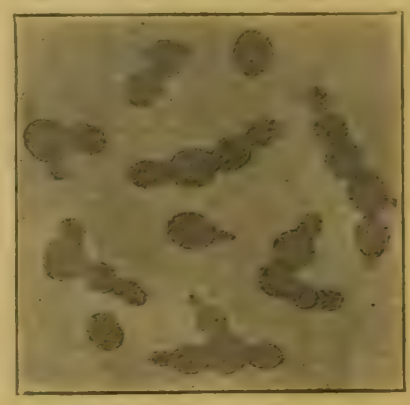

Fig. 7—Yeast Cells. Highly Magnified.

ly it becomes as large as the original cell, when it in turn may begin to bud. This budding continues until there are produced large irregular shaped groups. (Fig. 7.) Later these groups may be broken up and the cells go into a sort of resting stage, Each cell remaining by itself. Each of these single cells is capable ol growth and multiplication by budding as soon as it is placed in any material that furnishes the proper food for its development. Hence yeast may be likened to other plants

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhoea** or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse Scanty or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels**, bearing down feelings, nervousness, creeping feeling **up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhoea, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

THOUGHT SHE WOULD SURELY DIE

HAD PAINS AROUND THE HEART AND SMOTHERING FEELINGS

Mrs. Wm. Lee, Uhthoff, Ont., writes:—"I have taken three boxes of Milburn's Heart and Nerve Pills, and am now well. I had such pains around my heart and such smothering feelings that I thought I would surely die. My head used to be propped up with pillows to keep me from smothering. One day I read in a paper about your Milburn's Heart and Nerve Pills, and three boxes cured me."

Milburn's Heart and Nerve Pills are a specific for all run-down men and women, whether troubled with their heart or nerves, and are recommended by us with the greatest confidence that they will do all we claim for them.

Price 50 cents per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

the seeds of which require, among other things, a favorable soil in which to germinate and reproduce the plant.

The most favorable food for the common species of yeast is sugar, and they will not grow rapidly unless sugar is present in considerable amounts. Bread dough ferments because it contains some sugar. Flour itself contains a large percentage of starch, part of which is changed to sugar, which is then fermented by the yeast present, with the result that there are formed two main products, alcohol and carbonic acid gas. It is the latter product that makes the sponge "raise." When the dough is baked, the alcohol is evaporated by the heat and the gas is expanded, making the loaf still larger and "lighter." Other chemical products than alcohol and carbonic acid gas are formed in small amounts during the fermentation, and these have some influence in determining the flavour of the bread.

It has been shown that suitable food is essential for favorable growth of yeast. Another essential for the most rapid growth is a favorable temperature, and this factor is one of extreme importance in successful breadmaking. The best temperature for different species of yeasts varies with the species, but the average is about 80 degs. F., or a little below blood heat. At low temperature the growth of the yeast is checked, and, consequently, fermentation does not proceed so rapidly. Cold temperatures do not kill the yeast, and when a favorable temperature is again furnished, growth proceeds as before. At temperatures above 100 degs. F., or body heat, the vitality of the yeast is weakened proportionately as the temperature increases, until at the boiling point it is entirely destroyed.

Although yeast is not killed or injured by low temperatures, yet, there is a disadvantage in allowing the temperature to get too low in preparing the sponge for bread. Flour frequently contains other organisms than yeasts (bacteria and molds), some of which are able to grow rapidly in the dough at temperatures lower than the optimum for yeasts, and form objects which impart an undesirable flavour to the bread. Even the commercial yeasts may contain such undesirable organisms.

The two types of trouble most commonly met with are sour bread and slimy bread.

Dough may sometimes appear to rise well, but after the bread is baked it is found to have an unpleasant sour taste. This is due to the development in the dough before baking of acids produced in the growth of bacteria which are present in the flour, in old, or impure yeast, or in unclean utensils used in the process.

In the case of slimy bread, the sliminess is not usually apparent when the bread is freshly baked, but appears in a few hours, caused by the growth of bacteria that were not killed in the baking process. These slime-producing bacteria may arise from the same sources as the acid-producing bacteria. The remedy in either case is to use clean, high-grade flour, fresh, pure yeast, and to see that all utensils are scrupulously clean. In addition to these precautions, it should be remembered that correct temperature is the most essential for the normal development of yeast.

OTHER METHODS OF LEAVENING BREAD.

Many attempts have been made to prepare materials that will replace yeast in breadmaking. It is evident that if a compound or mixture of compounds could be prepared that would give off carbon dioxide regularly, it might take the place of yeast as a leavening material. But nothing has been devised that has proved a success. Baking powders act well for biscuits and such work, but they have not given good results in the large mass of dough prepared in breadmaking. The "self rising" flour sometimes advertised is really flour mixed with materials of this nature. The chief objection to the use of any of these yeast substitutes is that they may be inefficient or harmful; that they are easily adulterated, and that the bread made from them is lacking in the flavour and aroma good yeast fermentation produces.

In some places "aerated bread" is made. The details of the process are kept more or less secret, but the dough is made to "rise" by means of carbon dioxide injected into the dough in various ways. Sometimes a little fermented barley infusion from a brewery is put into the water used in making the dough. This appears to render the gluten more elastic and imparts some of the same flavour resulting from yeast fermentation.

The leavening of "salt rising" bread is dependent upon ferments originally present or acquired from the air. A common method of making it is to prepare a slack batter of milk and flour and allow it to stand at a temperature of about 100 degs. F., until the ferments permeate the whole mass, or until it becomes sour. This is then mixed with a sponge prepared with hot water and flour, to which a little salt has been added. After thoroughly kneading the batter and the sponge together, it is put away in a warm place and the leavening action started in the batter spreads through the whole mass and produces a light, porous loaf of bread. It is an illustration of a self-raised bread, but as it is dependent upon the natural ferment content of the flour and the ferments that may get into it from the air, the method is uncertain.

(Continued in next issue)

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught, through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

O.K. Canadian Potato Digger

Don't try to plow up the potatoes, or dig them out with a fork or hoe. It's back-breaking, disagreeable work and you always lose a percentage of the potatoes, which are missed. Let the horses and the **O. K. Canadian** dig your potatoes, and save you a long, tiresome job.

O. K. Canadian does all the work—digs all the potatoes. Soon pays for itself in the bushels of potatoes it saves that the old method would lose.

Write for our catalogue fully describing this great machine.

Stiff Competition the Salvation of the Manufacturer.

Absolutely no improvements are made in the quality of the product in any line where the manufacturers get together under a so-called "gentlemen's working agreement." The members of this agreement become stagnant. They are contented to drift along making a product as good as that produced by their competitors. Just as soon as competing manufacturers enter into a working agreement covering prices, terms, trade discounts or volume of production, they cease to reach out for improvements in quality, efficiency, durability, attractiveness of package and other trade winning advantages, till some day they awake with a jolt to find that their supposedly security intrenched position has been undermined and their trade is slowly slipping away.

Nothing in this world can stand absolutely still; so the manufacturer today must either go backward or forward—there is no middle ground.

A notable instance of this is shown today in the embroidery silk industry A few years ago some of the largest manufacturers of this commodity came to the conclution that they were not making a big enough profit and that the retailer was demanding too many free show cases and other trade helps. So they entered into a "gentlemen's working agreement" which proved to be a panacea for the trouble. They no longer fought each other tooth and nail for business, neither did they spur their factory superintendents on to innovations in an effort to reduce the cost of manufacture and improve the quality of the goods.

During this inactive period on the part of the leading silk manufacturers up sprung a new competitor, the manufacturer of mercerized embroidery silk. And when the silk manufacturers woke up, they found that the maker of cotton embroidery floss had secured a permanent hold on the embroidery business, something which they had never been able to do in the years gone by, in spite of repeated efforts to do so. Today the silk manufacturer has come to recognize the maker of cotton floss as a foeman worthy of his steel.

There are innumerable instances in trade such as cited above. But let us now turn to a group of manufacturers who from infancy have fought each other at every turn of the road. When acquaintances sit down in a friendly poker game they tack a sign on the wall that reads: "Here is where all friendship ceases," and this has been the slogan of the manufacturers of ready roofing.

The makers of ready-to-lay roffing in order to dispose of their product had to first convince the building owner that there was no reason why he should continue to use wooden shingles simply because his grandfather before him adopted that particular style of roof covering. As a matter of fact, grandfather had no choice of materials and wooden shingles in the early days were of much better quality and cost less than they can be bought for today.

Then came the fight against slate, tile and metal, a more modern product, but at a cost almost beyond the reach of the man of ordinary These materials are expensive beyond reach of the man of ordinary means. cause of the weight and consequent excessive cost of transporting. In addition they are expensive to lay and to make a perfectly satisfactory roof covering should be underlaid with a waterproof material which also adds to the total cost.

In the fight against wooden shingles metal, tile and slate, the manufactur-

THE ST. JOHN Business COLLEGE
S. KERR & SON

S. KERR Principal.

ers of Rubber Roofing were all of one mind, but each manufactnrer was working out his own salvation in his own way. The struggle for trade was fast and furious. At times when the smoke of the battle lifted, it was fodnd that certain manufacturers had sustained mortal wounds from which recovery was impossible.

Each manufacturer was constantly striving to improve his product and at the same time reduce the cost of making as well as selling. The resolt is today the builder can obtain an excellent quality of durable weather proof and water proof ready roofing at a price so low that he cannot afford to use any other style of material. Consequently the users of modern easy-to-lay Ready Roofing are saving thousands of dollars and the sale of ready roofing is growing by leaps and bounds. The man in the city and village, as well as the farmer, find by actual test that it is the best and most inexpensive roof covering obtainable.

One of the most enterprising manufacturers sells his product under a coined trademark name —Certain-teed—meaning Quality Certified and Durability Guaranteed. Instead of making a lot of extravagant claims for his Certain-teed Rubber Roofing he has settled the question of durability by guaranteeing it to last for a period of fifteen years. He also produces his modern roofing in the shape of Shingles as well as convenient Rolls.

The Certain-teed Shingles will be a revelation to the man who has never used them. They are a beautiful gray in color, similar in tone to slate, combining all the artistic beauty and attractiveness of other styles of roofing, without any of the drawbacks. As a consequence the Certain-teed Shingle is being specified by the owners of bungalows, expensive city and suburban homes—by the man who takes a pride in every detail of his building—those who aim for artistic effect, durability and economy— every one who appreciates a roof covering of attractive appearance.

Just so surely as stiff competition has been the salvation of the roofing industry, just so surely will it prevent dry rot and retrograding in any manufacturing industry.

By writing the General Roofing Mfg., Co., of Winnipeg, you can secure a copy of their book, "How to Build for Less Money," which contains many helpful ideas for those contemplating building or repairing any old building. Be sure to mention The Maritime Farmer.

Smut in Oats.

(Continued from page 795)

In the second August issue of the Maritime Farmer, W. M. Lea, a prominent, P. E. Island farmer states:—

"Sow as good seed as you can secure and treat it with blue stone or formalin to destroy the smut. This province is going to lose thousands of dollars this season with smut in the oats. Never in my experience have I seen it so bad. While on a ten mile drive through the country the other day I noticed many fields that have at least one third of the heads destroyed by smut, and one field particularly that I noticed where treated seed was sown did not contain any. We tried it this year on part of one field and the difference is amazing between the treated and the untreated seed."

In fields where the following treatment was applied to oats last spring I found no smut. One pint of formaldehyde in 40 gallons of water will treat 40 bushels of oats. The equipment used is a clean floor, a barrel, sprinkling can, scoop-shovel and plenty of sacks.

First, about 40 bushels of oats are

A Dirty Carpet
Or a Clean Painted Floor!
WHICH IS BETTER?

You KNOW which YOU would sooner have. You know which LOOKS the best and is the easiest to KEEP clean. Better decide now to freshen things up right away with a tin or two of M-L Floor Paint.

M-L

You should use M-L Pure Paint to paint anything that needs painting. It protects the surface covered better and longer than most other paints. You buy it in tins—all ready to apply. Made of guaranteed pure materials, mixed with twenty years' knowledge of paint-making for practical painters.

Think what a difference a few dimes' worth of M-L Pure Paint would make about the house. It would make some of the wood-work look like new—or a worn-bare, shabby-looking floor made spic and span as when you first walked on it with M-L Floor Paint.

PURE PAINTS

Paint the WALLS and CEILINGS with M-L Flat Wall Colors. You'll find it far easier to keep them clean and sanitary as well as brighter looking. Easiest to apply. The colors are clearer and brighter; keeps its FRESH LOOK longest. Artistic, sanitary, durable, washable and VERY economical.

M-L

M-L Is The Most Economical Paint You Can Buy

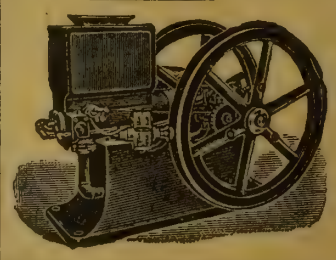
A New Name For The Best Farm Engine



Made in Air-Cooled or Water-Cooled Styles. Sizes 1 1-2 to 20 h.p.. Send for catalogue, prices and buying terms for farmers.

We have changed the name of our famous "CANADIAN" air-cooled and water-cooled engines to a name that also signifies quality.

Hereafter, these engines will be known as the "MONARCH."

It is a Monarch among farm engines. No engine runs better, is more compact, easier started, surer and steadier than this. Always remember the 'MONARCH.'

Every part is true to 1-500 in. or less. Experts work on each part. Material is the best money can buy. Bearings are big and wide, The design is compact, and every part is reachable. The "MONARCH" is reliable, simple, durable, powerful and dependable. Easy buying terms. Write us for catalogue. Our Company has a new name, too:—

THE CANADIAN ENGINES LIMITED
Formerly CANADIAN-AMERICAN GAS & GASOLINE ENGINE CO. Limited.
DUNNVILLE, Ont.

FROST & WOOD Limited, Smith's Falls, Sole selling agents for Eastern Ontario, Quebec and Maritime Provinces.

spread on the floor 5 or 6 inches deep. Second, oats are sprinkled with formaldehyde mixture until saturated. One man does the shoveling of oats while the other man sprinkles. Third, after saturation the pile is covered with blankets and sacks so as to keep the gas where it is effective. The pile is left covered for about 8 hours. The oats are then spread out to dry. Shoveling from time to time is necessary until the oats are thoroughly dried.

After applying this treatment the drill must be adjusted so as to make allowance for the swollen oat grain. The cost of this treatment amounts to about 25 cents for formaldehyde, and 25c. in labor for every 50 acres. Why not follow out the old proverb, "sow and ye shall reap," and in this case sow about 50 cts. and reap from $5 to $10?

Cause of European Foul Blood

The steps taken in the writer's endeavor to find the cause of European foul brood may be briefly summarized as follows:

(1) Bacillus alvei, which has been so generally spoken of as the cause of foul brood was isolateh from diseased brood, and pure cultures of the organism in both the vegetative and spore forms were repeatedly fed to colonies of healthy bees with the result that foul brood was not produced in any instance. This cast a suspicion that Bacillus alvei was probably not the cause of a disease.

(2) By a study of many larvae in samples of European foul brood it was frequently found that there were larvae apparently dead of the disease that contained Bacillus alvei only in small numbers or not at all. This increased the suspicion that Bacillus alvei was not the exciting cause of the disorder.

(3) In 1907 the writer proved that by feeding pure cultures of Bacillus larvae to healthy bees American foul brood could be produced. This fact still further emphasized the doubt that was already entertained concerning the possibilities of Bacillus alvei in the etiology of American foul brood.

(4) By feeding diseased larvae to healthy colonies it was found that European foul broad could be artificially produced showing that this disease, too, could be produced by feeding, and that the virus was contained in the diseased brood.

(5) Tne sick larvae of the disease thus artificially produced were frequently found, when examined, to be free from Bacillus alvei. This evidence, too, was damaging to the theory that Bacillus alvei is the cause of a braod disease.

(6) Bacillus alvei in this way was tentatively eliminated from the list of possible exciting causes of European foul brood. In a quite similar manner the other bacteria—Streptococcus apis, Bacillus mesenterious vulgaris, Bacillus orpheus, and Bacterium eurydice—were likewise eliminated from the list.

(7) Con?iderable quantities of filtrate from aqueous suspensions of crushed diseased larvae were fed to healthy colonies and in no instance was European foul brood produced This eliminated tentatively the probability of there being an ultramicroscopic virus in European foul brood the only factor that was not so capable of producing the disease.

(8) Bacillus pluton, therefore, was eliminated from the list of possible exciting causes of the disease and became thus the probable exciting causes of the disease and became thus the probable exciting cause of European foul brood.

(9) When this organism was studied in larvae in which the disease could be suspected by inspection one or more species of bacteria were sometimes found to be present also. These, when present, however, occurred in relatively small numbers.

(10) The disease was then studied in a still earlier stage—i. e., before its presence could be detected by gross examination of the larvae. This was done by cultures in part, but principally by fixing and sectioning larvae during the incubation period of the disease. This study demonstrated that in the production of the disease Bacillus pluton was the first invader of the healthy larvae.

It will be noticed, therefore, that in the determination of the primary exciting cause of European foul brood two objects were accomplished: (1) All the factors in the list of possible exciting causes of the disease were eliminated except the one organism, Bacillus pluton, and (2) by the study of infected larvae soon after the infection took place, this parasite was found to be the first invader.

As a conclusion, it is the belief of the writer that sufficient evidence has now been obtained to justify the statement that Bacillus pluton is the primary exciting cause of a brood disease. This brood disease is now generally known in America as European foul brood. This opinion is rendered in accordance with views now generally accepted relative to the etiology of animal diseases.

There are, then, three principal brood diseases. Two of these—American fodl brood, caused by Bacillus larvae, and European foul brood, caused by Bacillus pluton—are known to be infectious. From these two diseases there must be differentiated the third one, an apparently non-infectious disorder, the so-called "pickled brood." Larvae dead of this latter disease are particularly free from micro organisms. The exciting cause of thie disorder is not yet known.—Summary of a bulletin issued by the United States Department of Agriculture.

Crop Rotation and Soil Cultivation.

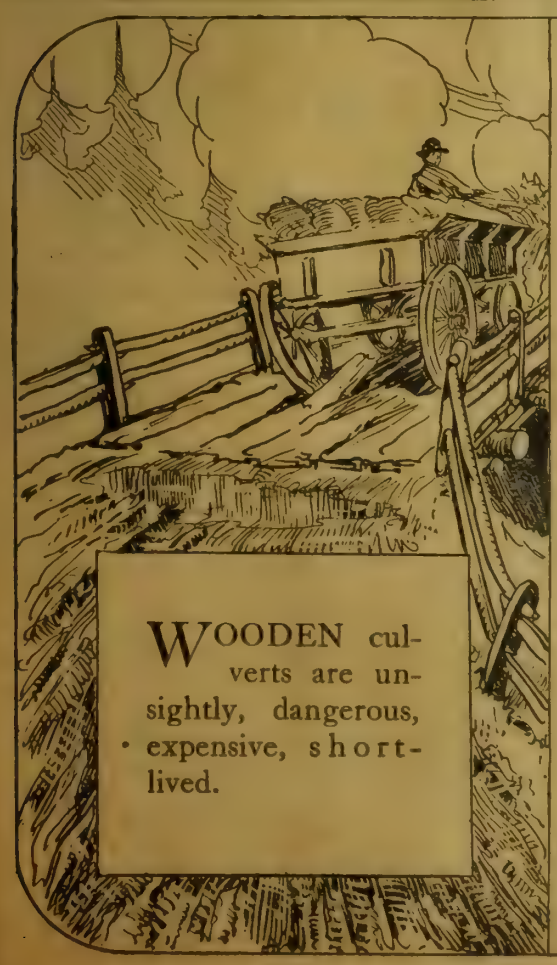
There has recently been received from Ottawa a pamphlet on crop rotation and soil cultivation. It embodies an address delivered by J. H. Grisdale, Director of Experimental Farms, during the past session of Parliament before the Standing Committee of the Senate on Agriculture and Colonization.

At the outset the point is made that crop returns depend on soil and soil management. The phamphlet then goes on to deal with soil functions, requirements of crops, rotation, cultivation, moisture, warmth, plant food, cultural operations and implements. Tnese subjects are subdivided until the field of successful crop growing is well covered. Under crop rotations, seven are described and explained. The three year rotation hoed crop, grain, hay—is highly recommended, more especially for farms that include considerable areas of rough land fit for pasture, but not available for crop production. Farms that are mostly arable are better served by a four year course which adds one year's pasture to the three year rotation mentioned. Any of the seven rotations, described if carefully followed and the cultural operations therewith performed at the right time and in the right way, are claimed by the author, to increase tremendously the crop production of any given farm and at the same time increase but slightly, if at all, the cost of production. This pamphlet which covers thirteen pages, is available to all who apply for it to the Publications Branch, Department of Agriculture, Ottawa.

The Song of the Shiftless Farmer.

My neighbor's been to big expense, to mow the weeds along his fence. He's worked away from morn till night, to get the wire stretched up tight. He's drove a new post here and there, and tacked the wire on with care. The fence looks better, I'll admit, but he won't get no cash for it. His work is wasted, seems to me, he'd better let the old fence be.

My weeds have all grown up so high, my fence don't show as folks go by. Some posts are gone, the wire's loose, but it don't show, so what's the use? Some folks are kicking on my weeds, they say that they will furnish seeds, to seed the country round about, but surely that's not my lookout! I'm satisfied the way it is, and if they want to kick, gee whiz! I'll just sit down awhile and smoke, and let them have their little joke.—Prairie Farmer.



WOODEN culverts are unsightly, dangerous, expensive, short-lived.

Which kind of a culvert does your waggon cross?

DOES the road *you* use pass over rickety, dangerous wooden culverts, that are constantly in need of repairs and often washed away entirely? Or is it carried safely across the low places by modern, everlasting culverts? Build your

CULVERTS OF CONCRETE

which not only cannot be washed away, but actually grow stronger with age and use.

Every farmer owes it to himself to insist that the money he pays for road-taxes be spent to the best advantage. As a ratepayer, he is entitled to the best roads that can be made with that money. When culverts are washed out, and the road rendered impassable, he not only suffers inconvenience but may also be caused financial loss by inability to get necessary supplies in time for spring planting. And at best, with wooden culverts, part of the money that should be used to make better roads must be spent every year for repairs.

Insist upon Concrete Culverts

It will pay you and everybody else in your county.

Canada Cement Company Limited
505-561 Herald Building, Montreal

LET us send you a copy of our free book, *"What the Farmer Can Do With Concrete."*

PORTLAND CANADA CEMENT — CANADA CEMENT COMPANY LIMITED MONTREAL

IF you want to know more about Concrete Culverts, write our Information Department.

CONCRETE culverts are neat, safe, need no repairs, and are ever-lasting.

Our Guarantee Bond

Signed, Sealed and duly executed, is furnished with every

ENTERPRISE MONARCH STEEL RANGE

certifying that we, as manufacturers, fully warrant and guarantee the Range represented by such Certificate.

Thus back of every MONARCH sold are our years of experience in stove making, and when we tell you that it is the best range we have ever produced, you will agree with us that it is (as the boys say) Some Class.

For Economy, Durability, Beauty of Design and special fitness for the work required, the MONARCH is recognized by stove dealers, housekeepers and Domestic Science teachers, as ahead of anything now on the market.

Ask your dealer to show you this range, or write us direct for illustrated circular.

The Enterprise Foundry Company,

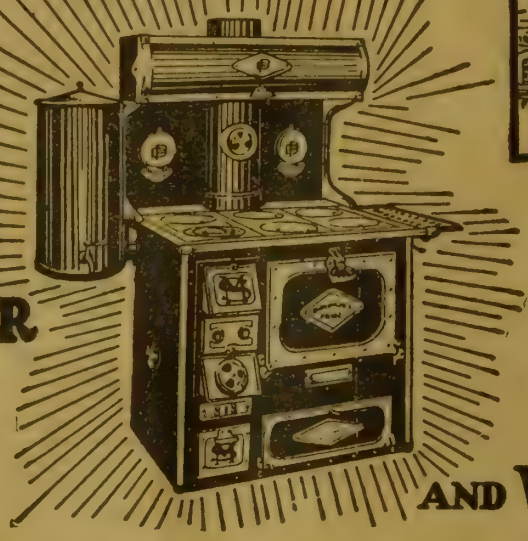
SUSSEX, N. B. CANADA.

DIRECT FROM FACTORY TO KITCHEN



SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

$41.00 TO $49.00

AND WE PAY THE FREIGHT

You can buy DOMINION PRIDE RANGE at Factory Price

Direct from the Largest Malleable Range Works in Canada

THE price which the Dealer quotes you on a Range is made up like this — Manufacturing Cost + Manufacturer's Profit + Jobber's Expense of Handling and Selling + Jobber's Profit + Retailer's Expense of Handling and Selling + Retailer's Profit + Freight.

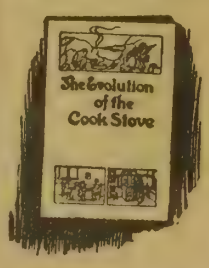
By our direct "Factory to Kitchen" selling plan all these charges are cut out except the actual manufacturing cost, a small profit, and freight. The difference to you is the difference between the $41 to $49 which you pay for a "DOMINION PRIDE" Range and the $69 to $78 which you would have to pay the Dealer for a Range which cost as much to make.

Are you anxious to contribute $25 or $30 to the middlemen?

In the—

Here is a Book Worth Having

IT tells about cooking from the time the Cave Dwellers used to put hot stones in the pot to boil it. The Book contains interesting information gathered from many sources and is illustrated profusely.



The "Evolution of the Cook Stove"

also tells all about the "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy this book.

Write for free copy.

"DOMINION PRIDE RANGE"

you get a full dollar's worth of actual stove value for every dollar you pay.

The "DOMINION PRIDE" is made of tough, strong malleable iron and the best blue polished steel—materials that will neither warp, crack nor break, so that it will last a lifetime. It is made in the largest Malleable Iron Range Works in Canada, and each range is backed by our unconditional guarantee.

The "DOMINION PRIDE" looks well, cooks well, saves fuel and is easily cleaned. You'll be proud of its neat, handsome appearance in your kitchen, and of the appetizing food it will cook to perfection for you. You'll appreciate the ease of keeping its blue polished steel surface and the bright polished top spick and span with a few rubs of a cloth. Your husband will be more than pleased with the reduction in the coal or wood bill—for the "DOMINION PRIDE" saves, by actual tests, 30% of the fuel.

A "DOMINION PRIDE" Range, with High Closet Shelf and Elevated Tank or Flush Reservoir, with Zinc Sheet to go under range, 8 sections Blue Polished Steel Pipe and 2 Elbows, will be delivered to any Station in Ontario, Quebec or the Maritime Provinces for $41, or to any Station in the Four Western Provinces for $49—$5 to be sent with order and balance to be paid when Range is delivered at your Station. If not convenient to pay cash we will arrange to accept your note.

Canada Malleable & Steel Range Mfg. Co. Limited, Oshawa, Ontario.

When writing it will be a distinct favor to us if you will mention this paper. 6

FOR SALE—One Pure Bred Hereford Bull, one year old; also one four year old bull. LYMAN A. WHITMAN. Maple Grove Stock Farm, New Albany. Annap. Co., N. S.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application, and you will get quick relief. For sale by all dealers.

THE "TORONTO" FLOOR GRINDER
SAVES LABOR, GRINDS BETTER, COSTS NO MORE

Some of its special features are:

Main shaft of 1 3-8 in. cold drawn steel, which is heavier than that used in other grinders; gives steadier running qualities and takes less power to operate.

Three bearings; other grinders have only two. This means smoother operation and fewer repairs.

Feed adjustment can be made with one hand. With other grinders two hands are necessary.

And the "Toronto" grinder costs no more than other grinders. Look into it now. A fully descriptive circular is yours free for the asking—A postal will do. Send for it to-day.

A HANDY BOOK FOR FARMERS.
You haven't any idea as to how valuable a Chapman-Stickney Gasoline Engine would be to you until you've read a book of facts and experiences. It's free for the asking. Send for one now—a postal will do.

Herd, boar and 3 females—1st, Chas. Servant.

DUROE JERSEYS.

J. E. Baker & Sons captured all the prizes in this class, without competition.

Get Busy With a Baler

IF you have clover, timothy, prairie grass, or alfalfa, it will pay you to bale it. Loose hay takes barn space. You cannot sell it easily and you cannot ship it at all. It is the hay that is baled which is in demand in the high-priced city markets. This is the hay upon which you make your profits.

The difference between what it costs to bale hay and the increase you get in price per ton, gives you a bigger margin of profit on your work than anything else you do on a farm. You can bale easily from 8 to 16 tons a day and under certain conditions, several tons more. Baled hay can be made as much a big cash crop to you as your wheat, corn, or oats. All you need is the right kind of hay press. There is money in owning an

I H C Hay Press

An I H C pull power press in either one or two-horse style, or an I H C motor press with a 3, 4, or 6-horse power I H C engine, will do the work required on any farm cheaper, quicker, and with less attention than any other hay press so far designed.

It has taken years of field testing to make these presses the best that you can buy. They are that now. The horse power presses have greater capacity than any other horse press of equal size. They are lighter draft and easier on the horses. The step-over is the lowest and narrowest made. They have an adjustable bale tension, which insures compact bales. They are equipped with a roller tucker to turn in all straggling ends, thus making each bale neat in appearance.

I H C motor presses consist of a bale chamber and an I H C engine mounted on substantial trucks. The bale chamber of the motor press corresponds in size to the bale chamber of the horse press—14x18 inches, 16x18 inches, and 17x22 inches. No time is lost in setting up the machine. It can be moved easily from place to place, backed to the stack or barn, and started to work at once. The engine does not need a man to watch it and there is no danger from sparks. When not baling hay, the engine can be detached. Two extra wheels, an axle, and a belt pulley are furnished, so that with a little adjusting, you have a regular portable I H C engine ready for business 365 days each year. You can operate a small thresher or corn shredder, saw wood, shell corn, grind feed, pump water, generate electricity, or run a cream separator. You thus purchase two useful machines in one. There is profit in the hay press and unlimited work in the engine.

Hay time is drawing near. Be prepared for it. Drop in and see an I H C local agent in your town, or write the nearest branch house for a catalogue.

Petitcodiac, N. B.

The Construction of Pig Sties.

(Continued from page 792)

oughly tarred felt. In the case of lean-to sties, the roof should be not less than 4 leet 6 inches above the floor at its lowest part, and about 7 feet at the back. This is necessary in order to allow the sty to be thoroughly cleaned, and also to enable the animals to be examined and tended in case of sickness. It also insures sufficient air-space, and facilitates proper ventilation.

AIRSPACE AND VENTILATION.

The air-space should not be so large that the buildings are cold, nor yet so small that, in order to secure sufficient ventilation, draughts are unavoidable. Ventilations should be secured by openings in the wall and roof. Lighting, which is most easily done by panes of glass in the roof, should be sufficient. In order to avoid scorching of the pigs, the glass should be roughened and thick. Sunlight is a good and cheap disinfectant, apart from its direct effect on the health of animals.

DRAINAGE.

Drainage is a most important point. It may be laid down as a general rule that there should on no account be a closed drain in any sty, and furthermore the drainage from each sty should be conducted separately to a main drain outside. The plan of draining a row of sties by one channel which passes through each in turn should never be adopted; the lower ones are apt to be wet and unhealthy, and if disease—e. g., husk—breaks out in any sty, all the pigs below it are likely to become infected by means of the drain.

TROUGHS.

The simplest and best trough is made of glazed fireclay, semi-circular in section, and set in concrete. It should be set in the centre of a partition which, immediately above the trough, should consist of a hanging door supported on an iron rail. When hanging freely, this door is immediately over the centre of the trough, but it may be pushed inwards, thus completely shutting off the trough from the sty, or it may be pulled outwards, leaving the trough open to the pigs. The advantages of the system are obvious; the pigs can be fed, or the trough cleaned out, without the attendant entering the sty, while ehere is no chute where food is apt to lodge.

COURTS AND RUNS.

Whether separate courts for the sties are provided or not, an extensive outdoor run is essential for sows and young pigs, and if possible a, dry, sunoy paddock should be provided for the purpose.—Journal of the Board of Agriculture.

Nova Scotia Provincial Exhibition, September 11th to 19th.

The Provincial Exhibition which opens at Halifax on September 11th will have many features that have never been seen before at a Provincial Fair. The foot races on the scale now contemplated are something new; The rivalry between the atheletic men of the college should draw a big crowd of devotees of the running track. The Mount Allison team have intimated their intention of coming to Halifax several days before the exhibition opens in order that they may train and get into the best of condition. There are races for other amateurs besides the college men and a good prize is offered for boys under 16 years.

The Horse Races are always interesting and sixteen of them for purses aggregating $6,800, the biggest yet.

The greatest feature of the Exhibition will be the Aeroplane flights by Walsh on a Curtiss machine, never before has an aeroplane been in Nova Scotia or indeed in the Maritime Provinces and this will be the first opportunity our people have had of seeing this form of aerial navigation. Far different from the old Balloon method now practically a thing of the past.

The Vaudeville will consist of seven acts headed by Cedora of the Golden Globe of death.A night performance in front of the Grand Stand will be completed with a magnificent and unexpected display of fireworks.

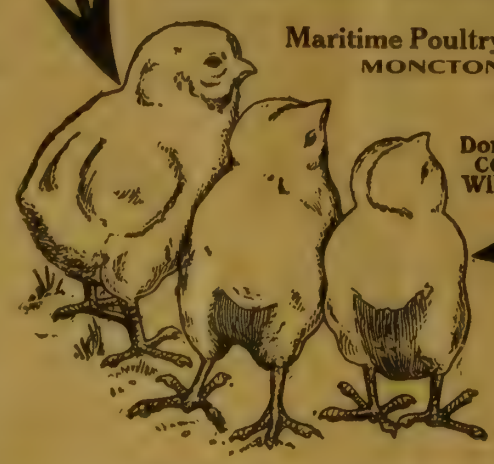
Maritime Poultry Supply Co.,
MONCTON, N. B.



To Feed Oats or Bran.

J. B. K., P. E. I.—Will you kindly tell me which will be the better thing to do, sell oats at 45 cents a bushel and buy bran at $30.00 a ton, or get the oats ground and feed it ?

Ans.—Oats at 45 cts. a bushel make them worth $26.47 per ton. Oats can be usually crushed for about 4 cents per bushel, or $2.35 per ton, which increases the cost of ground oats to $28.82 Since one pound of ground oats is equal to one pound of bran foe milk-making purposes, it is cheaper to feed oats at 45 cents per bushel, than to purchase bran at $30. per ton.

"Were all medicines as meritorious as Chamberlain's Colic, Cholera and Diarrhoea Remedy the world would be much better off and the percentage of suffering greatly decreased," writes Lindsay Scott, of Temple, Ind. For sale by all dealers.

Money Makers on the Farm

As I have so many enquiries about the care and management of turkeys, that to answer all and to give all the information required is so much of an undertaking and takes so much time I have gotten out a little book covering the whole subject, from the care and selection of breeding stock to the final chapter on fattening and marketing the birds. I am sure any one able to read can follow this and raise turkeys successfully. Complete details are given for getting up little coops for each brood costing no more than 25 cents each, and serviceable for many seasons. This book I will send for 23c to cover cost of printing and mailing. As I have only a limited number of this edition any one interested in raising 95 p.c. of all turkeys hatched should get a copy. Get this book and find out how turkeys may be reared as easily as chickens.

Sarah E. Moses Smith,
Woodward's Cove, Grand Manan.

Annappolis Valley Fruit Farm
$3050 Income Last Year

No man able to buy a farm can afford to miss the chance to get this 220 acres on the famous Minas Basin; 5 minutes walk to P. O. and boat landing; 8-room painted house, running water; large barn; orchard producing 400 bbls. apples in season; no better orchard land in the Valley; set to apples and a little time will make this equal to farms selling here for $40,000; cuts 30 tons hay besides large acreage used for crops; wood and timber valued at more than $1000; pasture for 40 head; extreme age of owner necessitates immediate sale; price only $3200, part cash, easy terms; for set of pictures, full details and traveling instructions to see this and other Nova Scotia farms, see page 62, our New Mammoth Farm Catalogue, No. 35 Box D, Sussex, N. Wheel The Scale To What You Want To Weigh

THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

Saves Money for Farmers and Dairymen

Thousands of farmers are losing money yearly through the inaccuracy of their scales.

It was to protect the farmers against these losses that the Renfrew Truck Scale was designed and built.

And it does protect them—by being absolutely accurate.

Gives the farmer ALL his profits on everything he sells by weight.

Saves for him time and labor—simply wheel the scale to what you want to weigh.

Weighs everything from 1 pound to 2000 lbs—and weighs it right.

To verify these statements :

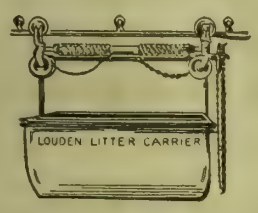
The Model Farm

Labor-Saving and Money-Making Equipment

A LOT HAS BEEN SAID about the scarcity of good farm help, and the difficulty our farmers have of keeping their sons on the farm. Well, most farmers have gone through the mill themselves, and can perhaps sympathize with the boy who seeks to get away from the drudgery that he imagines farm life has in store for him.

BUT WHY DRUDGERY? ABOUT the worst back-breaking work on a farm is stable-cleaning with old-fashioned methods. It certainly is a job any man would like to pass up. But fortunately modern methods with modern machinery have taken the drudgery out of stable-cleaning.

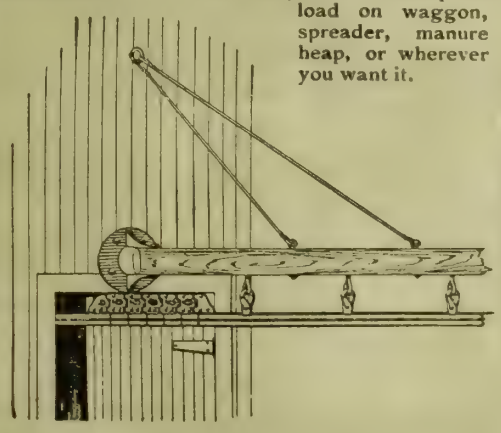


Nowadays, you fill a Louden Litter Carrier—raise it by a light pull on a chain—push the load easily and quickly to wherever you want it. Not much hard work for you in that, is there?

ALL EXPERTS AGREE THAT Liquid Manure is 50% more valuable than solid manure. Are you losing this 50%?

A Louden Litter Carrier will save it for you—and not only prevent the waste, but will make stable-cleaning an easy "chore."

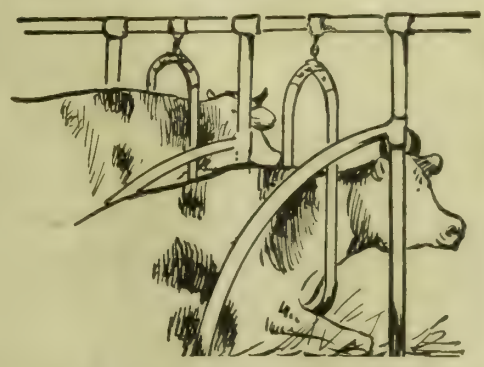
The Louden swinging equipment is an ideal way of disposing of manure. With it you get a twenty or a thirty foot swing, and can dump the load on waggon, spreader, manure heap, or wherever you want it.



A DISTINCT LOUDEN FEATURE is that you can run the loaded carrier right on to the pole while swinging at any angle. You do not have to straighten the track each load.

The *flexible hinge* permits the carrier to run over it while at an angle.

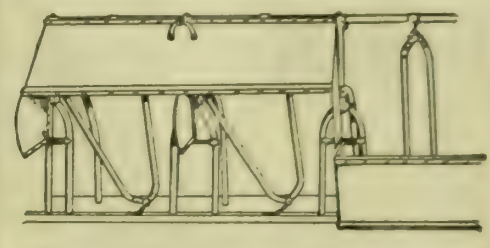
THE SUN-SHINY SIDE OF farming is the money-making side. An equipment that makes money is Steel Sanitary Stalls and Stanchions for cows. Now there is no doubt that a contented, comfortable, dreamy-eyed cow will give more milk than one housed in unsanitary, badly-ventilated quarters, where it has little freedom and comfort. And when you are thinking of cow profits, you must think of these things.



The most successful Farmers and Dairymen have thought of these things, and have equipped their stables with Cement Floors, Mangers, Steel Stalls, Stanchions, and Carriers for Feed and Litter. Stables so fitted are lasting, well ventilated and sanitary. Light and air with their germ-destroying powers fill every part of the stable. Under such conditions cows are comfortable and clean, which consequently means more and better milk, and this, in turn, means bigger profits.

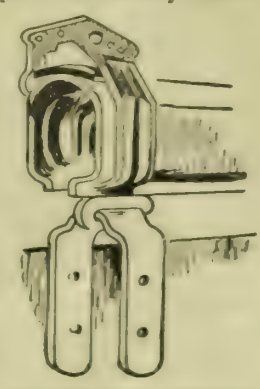
STANCHIONS. Louden Stanchions are perfect stanchions—perfect in construction—simple to lock and unlock—allow perfect freedom and comfort, yet provide a perfectly secure tie. They are made of smooth, light, strong, high carbon steel tubing, with malleable iron fittings. Construction and material are such that there are no crevices to harbor germs or dirt.

HOW DO YOU FEED YOUR cattle? Do you use the old-time shallow trough, where cows scatter their food in the feed-way, and steal each other's fodder—preventing the keeping of accurate records of feed costs and results?



Galvanized Steel Mangers are the modern way. They are convenient, and prevent feed-waste. They keep the stable tidy, too. The bottom is of cement, and the steel part is raised and lowered to allow the trough to be thoroughly cleaned. The trough can also be used for watering purposes.

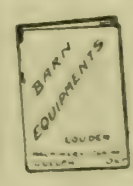
EVERY FARMER HAS experienced annoyance and loss of time and temper over faulty barn-door hangers and tracks. The Louden Hangers are made in five different styles, to suit various conditions. We recommend Louden's Bird-Proof Hanger as illustrated.



It is a hanger that gives perfect service all the year round. It always runs easily and cannot get out of order.

It cannot be clogged in any way—either by nesting birds or trash in summer, or by snow, ice or sleet in winter.

A USEFUL BOOK TO HAVE. Every farmer can find something useful in our book "Perfect Barn Equipments." It illustrates and describes many money-making, labor-saving devices, about which a farmer ought to know.

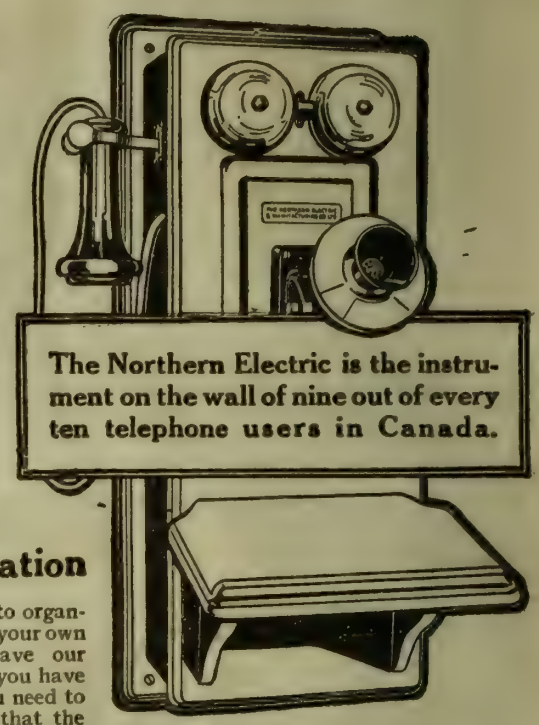


THE SERVICES OF OUR EXPERIENCED BARN ARCHITECT ARE AT YOUR COMMAND, FREE, FOR THE ASKING. TELL US WHAT YOU WANT.

THE LOUDEN MACHINERY CO. - DEPT. 18 - GUELPH, Ont.

LET US SHOW YOU HOW EASILY YOU AND YOUR NEIGHBORS CAN HAVE A TELEPHONE SYSTEM OF YOUR OWN

YOU—you and your neighbors—would have a telephone system for your own community, if you only realized how easily you yourselves could construct it and get it going. If you knew, in detail, how you and the people around you could form, own and control a local, self-maintaining company, for your own use and convenience, you would have such a system. There would be a telephone system in your community to-day if you knew how easily you and your neighbors could build every foot of the line and install every instrument yourselves—and especially if you realized that you do not need very much capital to do it either. Now, there is no reason why you should not know all these facts; for we stand ready to give you, for the mere asking, every bit of this information, provided only that you are sufficiently interested in the subject to write and ask us for it.



The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

We Will Explain All About Rural Company Organization

YOU do not need experience to organize a telephone company in your own community, when you have our book. It tells you exactly what you have to do and how to do it. All you need to do is to follow the instructions that the book gives and then get out and interest your neighbors. Whether you want to organize a mutual or a stock company, the book will tell you how.

We Send This Book FREE But Only On Request

"HOW to Build Rural Telephone Lines," is an illustrated, cloth bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells everything ; with it before you, you can organize your own company and construct your own line. It tells you absolutely everything you need to know, step by step, as you go along. There is no other book in existence that deals so thoroughly with every vital, essential fact. Remember, this book has cost a lot of money and careful study to prepare. We really ought to charge for it. However, we send it free on request—but ONLY on request. To get it you have to send us the coupon and thus signify that you are really interested. The book is too valuable to distribute haphazard.

You And Just Your Own Friends Can Build Every Foot Of Line

BUILDING your own line keeps down construction costs. With the help we give you, you do not need to employ expert linemen. The book explains the last word in line construction and contains, in this one chapter alone, thirty-seven diagrams and illustrations, showing how to make every kind of connection necessary, how to route the line, how to put the fittings on the poles, how to guy the poles, how to place the insulators and string the wires—in fact, how to handle every detail as well as an expert lineman can. On request, we will also tell you of your provincial regulations, what your government requires and what it will do to help you.

Let Us Explain To You How To Interest Your Neighbors

THE first step in getting started, is to enthuse your neighbors and get them all in with you. When you have read "How to Build Rural Telephone Lines," you will have a mass of information at your finger ends that will enable you to place positive, definite facts before your friends, to enthuse them with the idea of a self-maintaining, community-owned system and to make everybody around you anxious to help. All it needs to get a telephone system started, is for some one progressive man to start the ball rolling. With the information that we will place at your command, you can get everything organized in short order.

Send Us The Coupon Now

The Cost To Operate Your Own Line is Low

YOU can readily understand that when you and your friends have the entire management in your own hands, you can regulate the cost of running the line. In the book we explain just exactly what is necessary and you can take your pencil and figure out how little it will cost you to have a telephone on the wall in your own house.

There Will Be A Telephone System In Your Locality — Get Posted

SOONER or later someone is going to start a telephone system in your community, just as systems are being started every day in farming centres throughout the Dominion. When this subject comes up, you will want the full particulars before you. Now is the time for you to post yourself. The book tells you everything and, if you are interested, we will be glad to send it to you free. Do you care to sign the coupon and send it to us now?

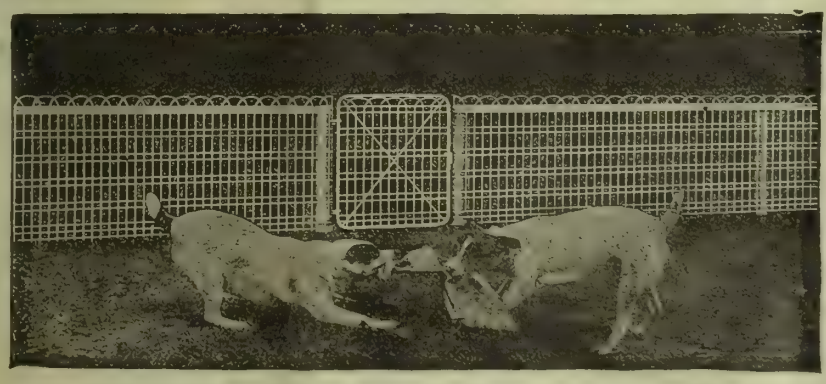
Vol. 17. SUSSEX, N. B., SEPTEMBER 24, 1912 No. 24

PAGE 'ACME' LAWN FENCE

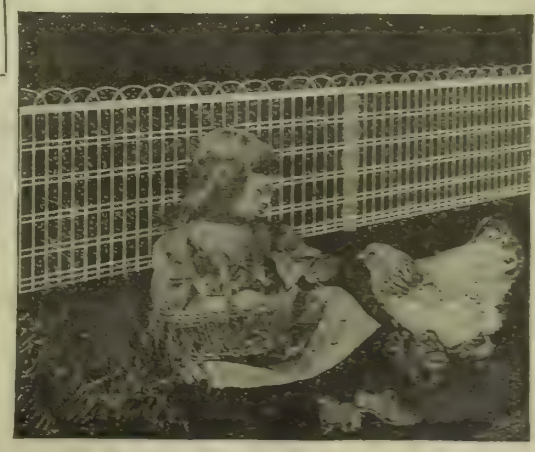
This famous 'Page' Fence comes in rolls up to 200 ft. in length. These are painted either white or green, and you may have "Page Acme" Fence in any height from 2 ft. to 6 ft. tall.

Be sure and get the genuine "Page Acme" Fence, for there are imitations on the market that resemble this fence closely. By getting the genuine "Page Acme" Fence you obtain high-carbon steel wire uprights, which are as stiff as thick iron rods.



This "Page Acme" Fence makes a beautiful fence for lawns, cemeteries, semi-public institutions, parks, etc. It is remarkably low in cost. When you consider the long life it has from being painted at the very beginning of its service, before you even set it up, you will see how economical it is to use this "Acme" Fence.

We have sold hundreds of miles, especially of the 42-inch width, and you will find this "Page Acme" Fence doing service all over the country. Write us today for the Page Catalogue of "Acme" Fences. If you need fence of any kind, remember the Page Catalogue shows it to you at Factory Price—scores of fences of the best quality.



Send Today for the Page Catalogue

This catalogue shows all kinds of Lawn and Farm Fences, fence material, iron fence—everything you possibly can need in this line at moderate prices. Write us today for the Page Catalogue.

What About the Boy Who is to Become a Farmer?

Give Him An Agricultural Education.---It is the Best Heritage . . You Can Leave Him. . .

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, N. S.

Tuition FREE to All Students from the Maritime Provinces

Next Session of Full Course begins NOVEMBER 5th, 1912

Next Short Course for Farmers and Farmers' Sons begins JANUARY 7th, 1913

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 7th, 1913

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time in English, Mathematics, Book-keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two years course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

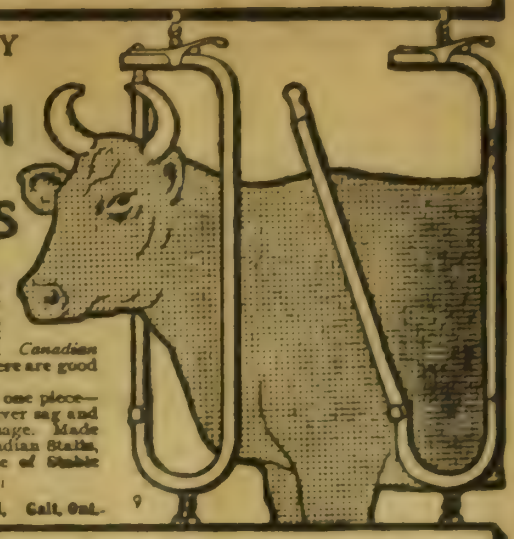
FACTS—NOT THEORY —ABOUT

O.K. CANADIAN U-BAR STEEL STANCHIONS

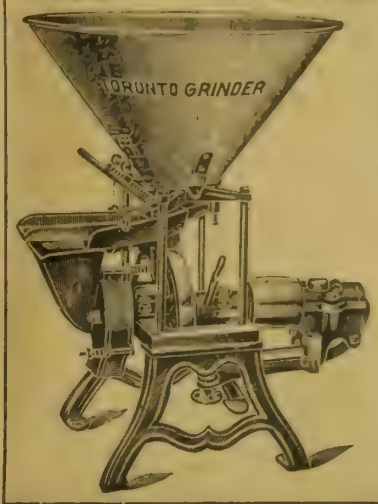


When big stables like the Central Experimental Farm at Ottawa—the new barn at Silver Spring Dairy Farm, Ottawa—the Brindale Farm at Toronto—are equipped with *O.K. Canadian U-Bar* Patented Steel Stanchions—there are good reasons for it.

O.K. U-Bar Steel Stanchions are of one piece—have no rivets or joints—therefore never sag and stand up against the most severe usage. Made in 5 sizes. We also make O.K. Canadian Stalls, Water Basins and a complete line of Stable Equipment. Write for catalogue.

Canadian Potato Machinery Co., Limited, Galt, Ont.

The "Toronto" Floor Grinder



SAVES LABOR GRINDS BETTER COSTS NO MORE

Some of its Special Features are:

Main frame built very low, solid and compact. Will stand heavy vibration better than other grinders.

Flow of grain manipulated by one hand, other grinders require two hands. Adjusting lever for plates easy to reach.

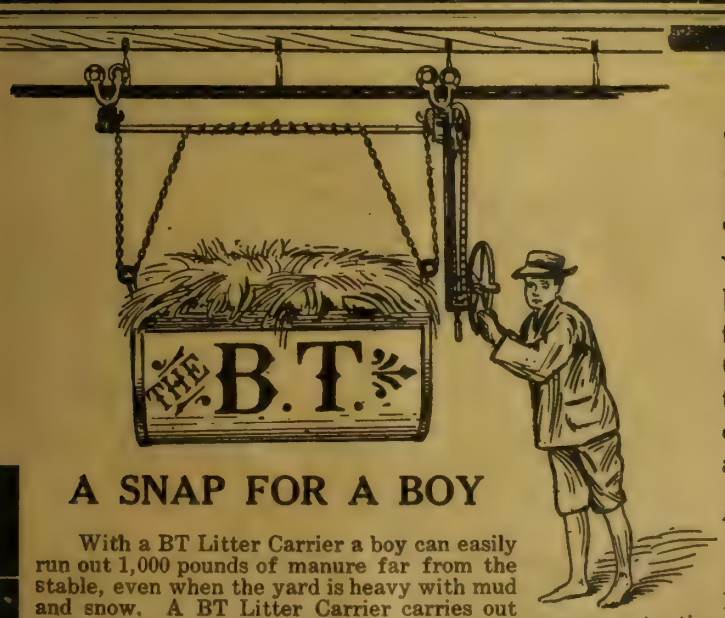
HOPPER: Large capacity, 3⅜ bushels. 50% more than other grinders.

No other grinder has so many improvements or is so efficient as the Toronto Grinder. You pay no more for a Toronto Grinder than you pay for an ordinary grinder.

You will probably need a new grinder this fall, so send us your name and address and we will mail you full particulars at once.

THE ONTARIO WIND ENGINE & PUMP CO.

Winnipeg TORONTO Calgary



STABLE WORK MADE EASY WITH A

BT Litter Carrier

You can lower the BT Litter Carrier right down to the gutter behind the stalls, and easily pitch FOUR wheelbarrow loads into the big wide-mouthed bucket. In a minute you can run the Carrier out a good distance from the barn and dump the load on the pile or into the wagon---no paths to shovel through the yard, or planks to lay---and the beauty of it is a boy can do the work as easily as a man.

A SNAP FOR A BOY

With a BT Litter Carrier a boy can easily run out 1,000 pounds of manure far from the stable, even when the yard is heavy with mud and snow. A BT Litter Carrier carries out four wheelbarrow loads at a time, so that a boy can do the stable work in half the time that a man would take with a wheelbarrow.

Write us today for Catalogue on BT Litter Carriers, and let us give you our prices. You will then see that a BT Litter Carrier will pay for itself in a single winter in the amount of time and hard work it will save you.

A BT Litter Carrier does Your Stable Work in a Hustle

It takes out HALF A TON of manure at a time. One big load cleans your stable. A muddy yard makes no difference, for the BT Litter Carrier runs on an overhead track, and can easily be run out with its biggest load. If you like, you can dump each load right into the wagon or manure spreader, and take the manure straight to the field. This saves you rehandling the manure and avoids the heavy work of cleaning up the stable yard.

It Makes a Clean Job

The BT Litter Carrier has a water tight tub. It does not drip along the passage-way and in the yard. It has elevated ends to prevent the manure from falling out when the bucket is full. The liquid and solid manure is all kept in the bucket until you reach the pile away out from the barn. It is easy to keep the manure a good distance from the barn, and the yard about the stable is always clean.

Feed all your cows in a single trip

The BT Feed Carrier holds 10 Bushels. In a single trip you can feed 25 cows. BT Feed Carriers, Feed Trucks, Milk Can Conveyors are indespensable to Dairymen and Farmers. They cut in two the labor, time and cost of feeding the cows and caring for the milk.

Fill out the coupon and get our prices

Let Us Send You Our Catalogue

Write for our Catalogue to-day. No matter how many cows you have, nor how long it takes you to clean your stable by the pitchfork-and-wheelbarrow method, if you put in a BT Litter Carrier you will save half the time and trouble. You can use the BT Litter Carrier to clean your cow stable, your horse stable, or your hog pen, and in every case save yourself disagreeable, tedious work.

Write us and get our prices. You will be surprised to find how cheaply you can put in a BT Litter Carrier outfit. Clip out the coupon and send it before you forget.

DE LAVAL
CREAM SEPARATORS

Cheapest As Well As Best

Every sensible person wants the **best** of everything, but in many things the best is beyond their means and they must necessarily be content with something else.

In the case of the Cream Separator, however, the **best** is fortunately the cheapest as well, and it is of the greatest importance that every buyer of a separator should know this.

Moreover, the **best** is of more importance in the case of the Cream Separator than in anything else, since it means a saving or a waste **twice a day every day in the year** for many years.

It is true that DE LAVAL Separators cost a little more in first price than some inferior separators, but that counts for nothing against the fact that they **save their cost every year over any other separator,** while they last an average twenty years as oompared with an average two years in the case of other separators.

And if first cost is a serious consideration a DE LAVAL machine may be bought on such liberal terms that it will actually **save and pay for itself.**

These are all important facts which every buyer of a Cream Separator should understand and which every local DE LAVAL agent is glad to explain and demonstrate to the satisfaction of the intending buyer.

If you don't know the nearest DE LAVAL agent please simply address the nearest of our main offices as below.

173 William Street, MONTREAL, CAN.

DE LAVAL DAIRY SUPPLY CO., Limited.

14 Princess Street, WINNIPEG, CAN.

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

The Nova Scotia Provincial Exhibition

Quality Exhibits

THE Nova Scotia Annual Provincial Exhibition was held at Halifax, on September 11th to 19th inclusive. The weather throughout the show period was quite favorable and the attendance was fairly well up to the expectation of the management.

THE MANAGEMENT AND JUDGERS

M. McF. Hall, the genial secretary-manager of the fair, and his capable staff or Superintendents in the various departments, made matters run as smoothly as possible. The work of judging the respective classes was rushed from the very start and as there were breed judges for each and every one of the heavier classes in the live stock department, the awards were placed with a despatch that was very satisfactory to the respective exhibitors. The prize tickets were all in place on Saturday evening so that visitors could plainly see "who was who" and round out their education by studying "why?" the various animals and exhibits were placed thus and so.

IN THE MAIN BUILDING

On the ground floor of the main building, various manufactring concerns made interesting displays in attractively decorated booths while the annex was occupied principally by automobiles and carriages of various descriptions and several displays of Cream Separators. The walls of the second floor department were occupied by the handiwork of the Manual Training and Kindergarten schools throughout the province.

THE MINES BUILDING

was occupied by various products exemplifying the mineral wealth of the province. Coal from the various colleries, iron and steel and their by—products in various stages of manufacture, were the most prominent displays in this department.

THE FISHERIES BUILDING

A visit to the fisheries building would hardly convince the uninitiated that the sea was one of Nova Scotia's greatest revenue producers. Were it not for an educational exhibit put up by the department of Marine and Fisheries the Fisheries building would have been closed to the public as there were not enough local exhibits to warrant any mention or notice.

THE LADIES DEPARTMENT

was well filled with women's work in the housekeeping, decorative, industrial and other handicrafts' sections. The Women's Council had a booth in the main building where talks were given each afternoon and evening by prominent experts on various lines of work that women may carry on the farm in connection with their domestic duties, that will reward them handsomely and furnish a goodly share of so called pin money.

MACHINERY HALL

contained exhibits of gasoline engines, wook working machinery, threshing machines and other implements of general interest to farmers and fishermen.

One of the interesting features was a sleigh, patented by Mr. John C. Cash, Irish Cove, N. S. It is built for coal or manure hauling. The box is placed on an elevated pivot so that it may be swung around and dumped in any desired direction without backing the team. It is an admirable rig for hauling manure out on the snow. There were no process exhibits.

THE HORTICULTURAL BUILDING

was well filled with fruits and flowers. There was a grand display of apples, plums, pears, and grapes and despite the earliness of the season the colouring and quality was excellent. In the county collections section the number of entries by the respective counties were :—

Annapolis, 2; Antigonish, 3; Cumberland, 2; Digby, 2; Hants, 3; Halifax, 6; Kings, 3; Lunenburg, 3; Pictou, 1 and Yarmouth, 2. The battle royal for the sweepstakes prize was waged between the first prize collections from Kings, Hants and Annapolis. The Kings county collection contained a total of 50 varieties made up as follows: Apples, 23; pears, 9; plums, 10; peaches, 1; grapes, 1; crabs, 1; berries, 4 and quince, 1. The Hants collection contained: Apples, 29; pears, 5; plums, 6; peaches, 1; grapes, 1; crabs, 1; berries, 5; quince, 1, a total of 45 varieties. The Annapolis county collection contained 49 varieties as follows: Apples, 20; pears, 8; peaches, 2; plums, 8; grapes, 1 and berries, 10. The sweepstakes prize was captured by the Kings county collection, shown by Seaview Farm, Starr's Point. B. F. Chesley, Bridgetown, had the best collection of plums. Seaview Farm, showed the best collection of peaches. preserves, jellies and vinegars and best collection, 5 commercial varieties of apples.

Mrs. Sarah E. Starr, Wolfville, made the best display of grapes. The best and most valuable collections of 20 varieties apples and the best collection, 10 commereial or export varieties was shown by Mrs. Wm. Sangster, of Falmouth, Hants County, therewith winning the Furness Withy Co. Silver tea service. It was won in 1910 by L. C. Healy and in 1911 by H. E. Bent. The rule governing its donation requires that the trophy be won three times before it becomes the property of the exhibitor. Mr. R. W. Starr, the veteran judge, of Wolfville placed the awards. The best collection of new varieties was shown by H. A. d'Almain, Wolfville.

AGRICULTURAL HALL

The display in the Agricultural Hall was very creditable, in fact better than one would look for this season, at so early a date. S. J. Moore, Maritime Representative of the Seed Division placed the awards in the Field Grains and Seeds section and G. B. McGill, of Middleton, judged the Field Roots and Garden Vegetables. The centre of the hall was occupied by a tastily arranged display by the Nappan Experimental Farm. containing fine specimens of the products of field, garden, orchard and apiary. The best collections of field roots were shown by B. F. Chesley and Hugh A. Dickson had the best collections of garden vegetables.

Apiary Products—The display of Apiary products was almost down to the vanishing point, there being only one exhibit of beeswax, liquid extracted honey and comb honey and two exhibits of extracted liquid clover honey.

Dairy Products—The butter and cheese exhibits were judged by Harvey Mitchell, of the Ottawa department, and W. A. McKay, of the Nova Scotia department of agriculture. There was no farm dairy cheese. Prince Edward Island cheese predominated. Geo. Vinten, of Lower South River and H. H. Gillis, Blue Sea Corner, upheld Nova Scotia's reputation for cheese making with 12 large cheese. The scores in the butter class ranged from 92 1-4 to 96 3-4 for the entries within the monies' pale. The remainder of the butter exhibits were not very high in point of quality.

THE AMUSEMENTS

The amusements in front of the grand stand consisted of horse racing, foot racing and various feats cleverly performed on the trapese and tight ropes. One of the most thrilling events was performed by a lady who motor cycled inside a huge globe at a speed of fifty miles per hour. The bird man met with an accident at the time of his trial flight. The machine was badly smashed and the aviator was severly bruised and skaken up. The racing was good and some rather thrilling events marked several of the heats. One horse was accidentally killed and another, after throwing her driver, went the two laps of the course without a driver, saved her distance and jogged home to the stables.

THE LIVE STOCK DEPARTMENTS

were pretty well filled and constituted the most attractive and interesting sections of the fair.

Horses

There were not so many entries in the horse classes as we have seen at Halifax in other years, but the quality of the stock showed a decided improvement. S. Fuller, Ottawa, judged the light horses and Jas. Henderson, of Belton, Ontario, placed the awards in the heavy horse classes. Mr. Henderson's placing at Halifax, upheld Mr. R. S. Starr's placings at St. John, in nearly every case and was quite satisfactory to the interested exhibitors.

THE THOROUGHBRED CLASS was very poorly represented, the only entries being a brood mare and foal of 1912, shown by Miss Alice O'Brien.

STANDARD BREDS.—Five speedy, aged stallions were jogged around the track to receive their just awards. Dr. N. Ronan, of Antigonish, captured the red ribbon and was followed by G. A. Mader's horse with the blue and by Blake Bros., of Shubenacadie in third position.

There were only two two-year-old stallions in the ring, shown by Angus McGilvary, of New Glasgow and L. B. Dodge, of Spa Springs, who were respectively placed in first and second positions.

E. L. Mosher, of Aylesford, had no competition against his two-year-old stallion.

The brood mare section was filled by five trappy steppers and their youngsters. Jas. S. Chisholm, of Brierley's Brook, and Angus McGilvary, New Glasgow, held the first and second prize winners, followed in third place by a mare and foal shown by T. D. Blaikie, of Great Village.

The Halifax Stables and Marion Blaikie, Great Village, had matters their own way in the four-year-old filly section. Halifax Stables had the only three-year-old filly while Angus McGilvary had the only two-year-old.

Chisholm, Blaikie and McGilvary came in for first, second and third monies on foal of 1912, and G. A. Maders horse was first with three of his get.

THE ROADSTERS.— Roadsters were out in good numbers; seven, brood mares with loals; six, three-year-olds; five, two-year-olds; six, one year-olds; seven, foals of 1912; seven, single horses in harness, over 15 hands, and one mare and three of her progeny comprised the class. The horses shown were the get of some of the most noted Standard Bred stallions in the Province. A full list of the prize winners will be found on page 828 of this issue.

CARRIAGE HORSES were few in numbers, there being only a single entry in each section of the class.

PONIES were well represented, but a few of the animals shown were not very typical of any particular breed.

GENERAL PURPOSE HORSES were few in numbers. There were three entries in the three-year-old class and four entries in the matched team section. There was only a single entry in the other sections of the class.

HEAVY DRAUGHT HORSES.—The heapy draught class was one of the classes that made the horse show at Halifax. Sharpe & McNeil, Wm. O'Brien, Jas. Leslie, Jas. McKenzie, G. W. Dawse, C. F. Grant, Wm. O'Brien & Sons and M. Dwyer were the principal exhibitors and had their horses out in fine shape. Clydesdale blood predominated and the various horses shown represented a class the raising of which, farmers would find a profitable industry.

HACKNEYS—With the exception of the second prize stallion, Sedgeforth Enterprise, shown by McFarlane Bros., a three-year-old stallion and a two-year-old stallion, respectively shown by Jas. D. Cox and Raodolph Cox, R. A. Snowball had everything his own way in the Hackney sections. Snowball's Model Performer was first in the aged stallion class and carried off the silver medal offered by the Canadian Hackney Horse Society for best stallion, any age. A Snowball mare carried off a similar honor in the female section.

Sedgeforth Enterprise was sold at the close of the fair, to Mr. Fuller, the judge.

PERCHERONS.—The entries in the Percheron class were not numerous. Two entries in the aged stallion section and a single entry in the remaining sections were all that the Percheron class could muster. There were some good individuals included in the number. Chas. Symes' captured the male championship with his three-year-old Lord Roberts and the female honors went to an Albert Flemming mare.

CLYDESDALES were really the classiest and best class at the fair. R. A. Snowball, Wm. O'Brien & Sons W. W. Black, Prescott Blanchard, G. C. Cossar and McFarlane Bros. were on hand to represent the most popular farm horses in Nova Scotia.

Seven aged stallions came into the ring, and after careful inspection, McFarlane Bros.' Baron Sduire and Vanderbilt were placed in first and third positions with R. A. Snowball's Baron Belgradden sandwiched in a second place. R. A. Snowball's three year-old stallion Chatham Fame captured the red ribbon from McFarlane Bros.' horse. G. C. Cossar and Wm. O'Brien & Sons had the only two-year old stallions. They were a good pair. Cossar's Dunbar Crag led the way.

Prescott Blanchard had the only yearling stallion.

Wm. O'Brien & Sons, had two brood mares with foals. W. W. Black's Miss McKay was sandwiched in between two Snowball mares in the aged mare class, four up.

In the two-year-old filly class Wm. O'Brien & Sons' filly was sandwiched in between two Snowball fillies.

R. A. Snowball had the only yearling filly, while Wm. O'Brien & Sons had the only foals of 1912.

The male championship and the Silver Cup, donated by the Dominion Clydesdale Association, for the best stallion, any age, was captured by McFarlane Bros.' Baron Squire. Snowball's May Lothian, first prize aged mare, was also the female champion.

The Queen Hotel Cup, for the best 5 horses, any breed, owned by the exhibitor, which was won in 1910 and 1911 by R. S. Starr, Port Williams, left the fruitful valley and for the next year will be found occupying a prominent place in the home of R. A. Snowball, Chatham, whose Clydesdale five were the best at the show.

Beef Cattle

Not for years has there been such a grand display of beef cattle as was at Halifax this year. Chas. F. Bailey Assistant Deputy Commissioner of Agriculture for Ontario placed the awards.

SHORTHORNS.—C. A. Archibald, R. A. Snowball, Dr. I. M. Lovitt and A. N. Griffin were on hand with their best shorthorns and made up by far the most interesting competition in the beef classes. Their stock was well fitted and some very typical arrivals were included in the class. C. A. Archibald's aged bull Prince Ideal, captured the male championship and A. N. Griffin's Senior Calf, Emily of Willow Glen, was good enough to tote off the female championship. A couple of the calves were not as well developed, for their age, as they might be. It makes a big difference in the further usefulness of an animal as to how it gets its first start in life and undoubtedly the lessons learned in keen competition at the shows will be the means of bringing the owner of those calves to a proper realization of the needs of a young calf, if he would have it develop into a thrifty, creditable show animal.

HEREFORDS.—W. W. Black and Wm. O'Brien & Sons were the chief contestants in the Hereford class. Thos. Aylward, Falmouth, had the only junior yearling bull. The white faces were out in fine fittle. W. W. Black captured all the first prizes and diplomas in the class. Wm. O'Brien & Sons had the second prize aged bull, and senior and junior yearling heifers. The whole class would have stood any amount of competition. The condition in which they were shown should be a lesson for others who show live stock classes for which there is not much competition.

DEVONS.—W. A. Pinkney had no competition against his Devons. He had an entry in nearly every section of the class and was awarded a first prize in every class. The class as a whole would stand better fitting for the show. The herd contains good foundation stock and with a little better fitting they would have made a much better showing.

GRADE BEEF CATTLE made a good showing. W. W. Black, C. S. Congdon, Wm. O'Brien & Sons and Thos. Aylward had their fingers in the money pie as will be seen by the published list of prize winners.

FAT CATTLE were shown by W. W. Black, C. S. Congdon, Wm. O' Brien & Sons and C. A. Archibald.

WORKING OXEN AND STEERS were exhibited by C. S. Congdon, Wm. O' Brien & Sons and Victor and Thos. Aylward. The class contained some good, useful pairs.

Dairy Cattle

The dairy cattle classes at Halifax contained the choicest pure bred herds found in Nova Scotia, New Brunswick and Prince Edward Island. Grades were also out in large numbers.. It was indeed a pleasure for the visitors to wander through the stables or stand beside the judging rings and watch the sleek, milky, profit producing animals as they were resting comfortably or lined up on the green, to be passed on by their respective judges.

The exhibitors in the dairy classes went home from Halifax perfectly satisfied with their placings. They had no reason for complaint as each and every breed was judged by a competent breed judge.

The chief squeal at St. John came from the Ayrshire men but at Halifax, Judge A. Kains, of Byron, Ontario, a prominent Ayrshire breeder, placed the awards in his class in a manner which left little or no room for adverse criticism.

J. Rufus Starr, Port Williams, N. S., placed the awards in the Jersey classes. Mr. Starr judged at Halifax on previous occasions when there was lively competition and so satisfactorily placed the awards that his services were again welcomed this year by the Jersey men.

R. Robertson, Superintendent of the Nappan Experimental Farm, placed the awards in the Guernsey class. Our Guernsey breeders place every confidence in Mr. Robertson's placings and we have heard many of them remark that they would rather show under Mr. Robertson than under any other Canadian judge.

The popular judge, R. S. Stevenson, Ancaster, Ontario, who judged the Holsteins, requires no introduction to a Maritime Show ring. He has judged at all of them and the parting word always is "Come again."

The Ayrshires made a great showing at Halifax. With the addition of a few animals shown by John McDonald & Sons, Shubenacadie, N. S. and the elimination of the Creighton herd, the competing herds were the same as at St. John. The St. John prize list, however, had two sections for aged cows and two-year-olds, in milk and dry, and the three-year-old section was divided into three classes viz. in milk, dry and Canadian breed, while at Halifax the in milk and dry cows competed in the same class. This is a fact that must be recognized when comparing the St. John and Halifax prize winners in this class.

Five aged bulls faced the judge and there was not a weak one in the quintette.

McIntyre's Bros.' Grange Kelly again proved the victorious one and toted off the red ribbon, followed in second and third places by M. H. Parlee's and Prescott Blanchard's herd headers. Grange Kelly also carried off the male championship diploma and was the sire of the prize winning quartette, get of one sire, seven fours in the ring.

Allison McDonald had no competition against his two-year-old bull.

Six, senior yearling bulls tripped into the ring and McIntyre Bros., M. H. Parlee and Easton Bros. held the successful ones. McIntyre Bros. held the only pair of junior, yearling bulls.

Prescott Blanchard, with a very typical, thrifty, senior bull calf, captured the red ribbon. Parlee led in the junior bull calf class. Thirteen tried and true aged cows kept the judge busy for a time and the line up they made was a most pleasing spectacle. C. A. Archibald's trim fresh cow was sandwiched in between two of McIntyre Bros.' good ones. It was regrettable that there were only three prizes offered in this section as a ciuple of other trios might have been taken out of the ring and still leave a creditable showing.

Blanchard led in the three-year-old class and thus was placed in the position he claims he should have had at St. John. Easton Bros. led in the two-year-old heifer class and McIntyre Bros. seized all the reds in the yearling and calf heifer sections.

McIntyre Bros.' Morton Mains Lady Nelly, (Imp.), the first prize aged cow, proudly led the way in the female championship while the two animals, the progeny of one cow, red ribbon went to a pair of their Culcaigrie' White Lady's. It will be remembered that Culcaigrie White Lady was the champion female at the shows for the last couple of years but her enviable career was cut short by death on the first of last May. Prescott Blanchard had the next best pair in the latter class, seven pairs up. McIntyre Bros. also captured the most coveted plums in both aged herd and breeders' young herd, Parlee following in second and third place in the former and Blanchard occupied a similar position in the latter class. Easton Bros. showed the third prize aged herd.

JERSEYS.

H. S. Pipes & Son had all the Jerseys at the fair with the single exception of the trim two-year-old bull shown by Blake Bros. The whole bunch was a credit to the owners and could stand strong competition.

Imported Fereor captured the male championship and was first with three of his get. True Blue was the winner of the female honors. Babbit was at the head of the list with two of her urogeny.

GUERNSEYS.

made a better sgowing this year than ever before at Halifax.

H. W. Corning, Roper Bros., A. H. Snide, Hugh A. Dickson, T. D. Blaikie, Jas. McKenzie and D. G. McKay & Son were on hand with their best. Some of these exhibitors are new to the show ring but they are all enthusiastic over the merits of the Guernsey cow. Corning's aged bull, Island Prince of Hillside, captured the male championship and was at the top of the list with three of his get.

Roper Bros.' Dolly of Willow won the female championship and was also first with two of her offspring.

Corning captured the red ribbon in the aged herd class and the red and

blue on young herds. Roper Bros. had the blue ribbon winners in aged herds and D. G. McKay & Son came in for third money in the same class. Dickson led the way in the three-year-old cow and senior yearling bull classes. See published list of awards for the reaminder of the winnings in this class.

HOLSTEINS.

There were three herds of the ever popular black and whites. Practically the same line up as at St. John. J. D. Irving, Lea & Clark and Harding Bros. being out with thre particularly strong herds. There were no Nova Scotia Breeders showing this year. Samuel Dickie & Sons and Logan Bros. the veteran Nova Scotian Holstein men did not show. The Cobequid herd is being pushed for production and the Homestead herd has been selling off some of its good ones to fill the gaps in some of the best herds throughout Canada. We are informed, however, that the Homestad herd still numbers in the vicinity of sixty and that it will be out next year as strong as ever.

J. D. Irving's Sea View herd captured the lion's share at Halifax and thus repeated their St. John show record. Both male and female championships went to the Sea View herd on Lord Sea View Rooker, a two-year-old bull, and Rose of Bonheur Beauty, an aged cow.

Lea & Clark had Ida Rooker's II. Vale to top the section for bull and three of his get, while their Jacoba Johanna was first with two of her offspring. Harding Bros.' Wish Ton Wish herd in the senior calf classes.

The three herds were out in exceptionally good fit and each and every arrival in the ring reflected no discredit on their owners.

GRADES.

Holstein grades and Ayrshire grades competed in the same classes while Jersey grades and Guernsey grades locked honors in their class. The grades were all shown by Nova Scotian farmers and happy the farmer is whose stables are filled with such animals as were exhibited in these classes at Halifax. They all had the appearance of belonging to the "keep the farmer" class.

Sheep

The sheep classes were the same as at St. John. C. F. Bailey placed the awards. The respective breeders had their flocks out in fine shape and the visitors to the fair had ample opportunity to study breed type.

Swine

The main contest in swine took place in the Yorkshire and grades classes. The Yorkshires were represented by C. J. Keiler's and J. W. Calbeck's herds and both breeders were out to win....H. W. Corning had no competition against his White Chesters, Poland Chinas and Duroc Jerseys were in the same hands as at St. John. Grades, fat pigs and bacon hogs made a very creditable showing.

Poultry

There was a large showing of poultry, which was effectively judged by D. J. Lambert of the Kingston, R. I. Experimental Station. With the exception of the question of rainment, which was somewhat the worse for wear, and of color, the poultry classes were in good form. The utility breeds were well represented and there was a fair showing of the fancy and ornamental classes.

Turkeys were below the average in point of numbers. Tolouse Geese and Pekin Ducks made a good showing.

THE CLOSING DAYS.

The aviator succeeded in getting a new machine in time for the last days of the fair and his aerial stunts and his conquest of the air pleased the spectators.

The Charlotte County Exhibition.

The fourth annual fair of the Charlotte County Agricultural Society, held in St. Stephen, Sept. 10th-13th, was a decided success in every way. In looking over many of the exhibits it was hard for one to realize that this was only a county exhibition.

The weather was fair throughout and from 9 A. M. to 10 P. M. crowds of enthusiastic people thronged the buildings and grounds.

The gates were first opened Tuesday, Sept. 10th, and the judging of the various exhibits commenced.

THE OFFICIAL OPENING.

The official opening was held Tuesday afternoon.

F. M. Murchie, President of the Association, presided and thanked all for the work they had so cheerfully performed and the exhibitors for their splendid contributions to the most successful exhibition of the association.

Mayor Dinsmore cordially welcomed all to the town and to the exhibition, trusting that all would carry away an impression so favorable that they would again return.

S. L. Peters, of the Dominion Department of Agriculture, followed in an enthusiastic speech expressed his pleasure at again being present at the Charlotte County exhibition. He appreciated the exhibits presented for inspection and was favorably impressed with this county as compared with other sections of the Province.

Hon. Geo. J. Carke spoke of the benefits to be derived from such exhibitions and, at the request of the society, formally declared the exhibition open, inviting all to enjoy its many features.

His Honor, Lieutenant Governor Wood, was present Wednesday afternoon and made an interesting and inspiring address.

The children of the public schools, who were generously provided with tickets by Gilbert W. Ganong, chairman of the board of school trustees, marched to the grounds and heard the governor's address.

THE EXHIBITS.

The exhibit of live stock was fairly complete and representative in every department. The horses of various classes were shown in good condition and the owners of many of them had good reason to be proud. The cattle, sheep and swine, while they were not so numerous and, in some cases, rather lacking in condition, showed that the farmers were taking considerable interest in the improvement of their stock and there is every liklihood that future exhibits of live stock will be much better than they have been in the past.

The poultry house was filled to over-flowing with poultry of a good type in excellent condition. Mr. Seth Jones did not hesitate to say that, in quality, the poultry at this exhibition was superior to that at St. John.

The display of vegetables was large and of excellent quality, surprising all, for it was feared that the unfavorable season would have its effects upon these crops. The potatoes particularly, in quantity and quality, excel all previous exhibitions in this section.

The fruits shown were very numerous and made a very attractive display in which size, uniformity and good colouring were very noticeable. Such a display has never been shown in Charlotte County before and this is the result of rapid strides which have been made in horticultural lines.

The displays of flowering plants, fancy work and home cooking were attractive, interesting and worthy of high commendation.

The exhibit of dairy products was large and attractively displayed in a refrigerator show case with glass sides. Some of the butter was of good quality while some was lacking in one or more of the points of excellence to be found in first class butter. Butter-makers will derive much benefit from exhibiting their butter at such exhibitions by learning, from such an experience, wherein they have made their failures in the past.

The section allotted to the manual training department, of the public schools, showing boys at work and some of the finished products was of great interest to many.

The first floor of the main building was taken up by exhibits in booths of the local manufacturers and merchants. These exhibits were attractively arranged. Also on this floor was an exhibit from the Dairy Division, Ottawa, consisting of milk samples showing results of contamination, cow-testing outfits for the keeping of records of individual cows, and model of tanks for cooling milk and cream.

ATTRACTIONS ON THE GROUNDS.

The "Midway" was a lively one with all kinds of amusement features from the ever popular merry-go-round to the chance of making a fortune for a nickel.

The Curson Sisters in their aerial stunts, Count Lagusta, the wire and juggling comedian and Professor Tourcher, sensationalist, cyclist, farnished free amusement to the crowds in attendance.

The agricultural history of Charlotte County is of recent origin. Previous to a few short years ago the principle industries of this county were lumbering and fishing, agriculture taking a very minor part. While the fisheries are still carried on along the coast, the lumber has to a large extent been cut. With the disappearance of the forests many men had to turn to another source for their living and those who have turned to agriculture have found the real valuable resource of the county. The result is that in recent years Charlotte County has been making rapid strides in agricultural lines. They have made a good start and the outlook for agriculture in the future of this County is bright indeed. One has but to talk with a few of the farmers to feel the spirit of optimism and enthusism that prevails. It is due, to a large extent, to this spirit that such rapid strides have been made and it is to this spirit that we look for future development.

The success of the exhibition is due, in a large measure, to the work of Walter S. Stevens, Sec'y of the Association, and his assistants. They have, by strenuous work, made the exhibition of 1912 a decided success and to them much credit is due.

New Appointment to the Staff of the Nova Scotia Agricultural College.

Mr. Robert Matheson, Ph. D., Cornell, at present Assistant Professor of Biology at Cornell University, Ithaca, has been appointed Provincial Entomologist for the Province of Nova Scotia and Professor of Zoology at the Nova Scotia Agricultural College. Mr. Matheson is a native of Pictou County, Nova Scotia, and graduated from the School of Agriculture under the management of Prof. H. W. Smith. After taking his Masters degree at Cornell, Mr. Matheson for two years occupied the position of State Entomologist for North Dakota. Returning to Cornell, he took his Doctors degree with high honors and was immediately appointed to the staff of that institution. Dr. Matheson is recommended by the Cornell University authorities as being one of the most promising student graduates from that Institution for some years and his work, since graduation, has been of such a high character that he was held in very high esteem by his colleagues. Had it not been for the fact that he appreciated the opportunity of being able to serve his native province, it would have been difficult to secure his services for the position which he has now accepted.

Dr. Matheson will teach the subjects of Zoology, including Entomology, at the Agricultural College, but the greater part of his work will have to do with the investigation of Entomogical problems in the Province of Nova Scotia and the administration of various measures for the prevention and extermination and control of insect pests.

With the large additional space which the new buildings, which are now in the course of construction at the Agricultural College, will afford and the strong additions to the staff which have been made during the past summer, the Nova Scotia Agricultural College is now in a better position than ever to carry on its work for the advancement of agriculture in the east.

The faculty are looking forward to next session, which begins on November 5th, as the most successful session yet held in the history of the institution.—M. Cumming.

Canadian Crops.

A bulletin issued on September 14th by the Census and Statistics Office of the Department of Trade and Commerce reports the condition of crops and live stock at the end of August and gives preliminary estimates of the yield of spring wheat, rye, oats, barley and flaxseed as compiled from the reports of correspondents upon the appearance of these crops.

The cold, wet weather which prevailed throughout Canada during August delayed ripening and the harvest is everywhere later than usual; but no serious frosts have as yet been reported. All crops show an improvement since the end of July, excepting peas, beans and corn. The average condition of spring wheat is 84.57 p. c. of the standard or full crop, which is represented by 100; rye is 84.14, barley 87.29, oats 88.15, mixed grains 86.57 and flax 87.84. These figures are higher than those of a month ago by about 1 p. c. for wheat rye and flax, 4 or 5 p. c. for barley, mixed grains and buckwheat and 7 p. c. for oats. On the whole they compare not unfavorably with the figures at the corresponding date of last year, oats, barley, rye, buckwheat and mixed grains being in fact higher, while spring wheat is about two points lower. Peas are 74 against 76 last month and 72 last year; beans are 76.71 against 79.27 last month and 80.92 last year. Corn for husking is 69.66 and for fodder 76, compared with 70.37 and 73.19 last month and with 81.46 and 86.55 for last year. Root crops and pasture show an excellent condition, the figures ranging from 86.64 for sugar beets to 92.10 for potatoes and 91.79 for pasture.

From the reports furnished by correspondents it is calculated that of the areas sown in Canada 3 p. c. spring wheat, 2.3 p. c. oats, 2.1 p. c. barley and 3.8 p. c. flax will from various causes, such as hail, flood, pests, etc., be entirely unproductive, and the following preliminary estimates of yield are therefore based upon the areas to be harvested. Of spring wheat the average yield per acre for Canada is provisionally placed at 21.08 bushels which upon a harvested area of 8,971,400 acres makes the total yield of spring wheat to be 189,266,000 bushels. This quantity added to the estimate of 16,773,300 bushels of fall wheat as published last month gives the wheat total as 206,029,300 bushels compared with the final estimate for 1911 of 215,851,000 bushels. The yield per acre in 1911 was 22.19 bushels for fall and 20.63 bushels for spring wheat.

Halifax Exhibition Prize Winners.

Horses

THOROUGHBREDS.

A brood mare and foal by her side were the only entries in the Thoroughbred class, prizes on which were awarded to Alice O'Brien.

STANDARD BREDS.

Stallion, 4 years old.—1, Dr. N. F. Ronan; 2, G. A. Mader; 3, Blake Bros.

Stallion, 3 years old.—1, Angus McGillivary; 2, L. B. Dodge.

Stallion, 2 years old.—1, E. L. Mosher.

Brood mare with foal by her side.—1, Jas. S. Chisholm; 2, Aogus McGilvary; 3, T. D. Blaikie.

Filly, 4 years old.—1, Halifax Stables; 2, Marion Blaikie.

Filly, 3 years old.—1, Halifax Stables.

Filly, 2 years old.—1, Angus McGilvary.

Foal of 1912.—1, Jas. A. Chisholm; 2, T. D. Blaikie; 3, Angus McGilvary.

Stallion and 3 of his get.—diploma, G. A. Mader.

ROADSTER HORSES.

Brood mare with foal by her side.—1, G. A. Mader; 2, J. F. Grant; 3, S. H. James.

Filly or gelding, 3 years old.—1, Ottis Gardiner; 2, E. L. Foster; 3, Marion Blaikie.

Filly or gelding, 2 years old.—1, E. L. Foster; 2, John McLellan; 3, Robt. Settle Jr.

Filly or gelding, 1 year old.—1, G. A. Mader; 2, R. A. Backman; 3, Jas. Adams.

Foal of 1912.—1, G. A. Mader; 2, John McDonald; 3, Robt. Settle Jr.

Single horses in harness.—1, Fred Parsons; 2, L. B. Dodge; 3, Mrs. C. H. Wisener.

CARRIAGE HORSES.

Filly or gelding, 3 years old....1, J. A. Plumney.

Filly or gelding, 2 years old.—1, Mrs. C. H. Wisener.

Filly, 1 year old.—1, J. F. Grant; 2, Fred H. Deal.

PONIES.

Stallion, over 12 and under 14 hands.—1, 3, John Feetham; 2, Christopher Purcill.

Mare or gelding, over 13 hands.—1, Louis Garier. ...

Mare or gelding, over 12 hands.—1, Leo Dunn; 2, C. Purcill.

GENERAL PURPOSE HORSES.

Mare or gelding, 4 years old.—1, W. R. Perkins.

Mare or gelding, 3 years old.—1, M. Dwyer; 2, Wm. O'Brien & Sons; 3, John McDonald.

Filly or gelding, 2 years old.—1, John McDonald.

Filly or gelding, 1 year old.—1, Geo W. Dawse.

Foal of 1912.—1, Fred H. Deal.

Matched team.—1, Fred H. Deal; 2, W. W. Black; 3, John R. McKenzie.

HEAVY DRAUGHT HORSES.

Mare or gelding, 4 years old.—1 and 2, Sharpe & McNeil; 3, Wm. O'Brien & Sons.

Mare or gelding, 3 years old.—1 and 2, Sharpe & McNeil; 3, Jas. Leslie.

Mare or gelding, 2 years old.—1, Wm. O'Brien & Sons; 2, Jas. McKenzie; 3, Sharpe & McNeil.

Filly or gelding, 1 year old.—1, Sharpe & McNeil; 2, G. W. Dawse.

Brood mare with foal by her side.—1, M. Dwyer; 2, Wm. O'Brien & Sons; 3, J. F. Grant.

Foal of 1912.—1, J. F. Grant; 2, Wm. O'Brien & Sons; 3, M. Dwyer.

Matched team.—1, Wm. O'Brien & Sons.

Mare and 3 of her progeny.—1, Sharpe & McNeil.

HACKNEY HORSES.

Stallion, 4 years old.—1, R. A. Snowball; 2, McFarlane Bros.

Stallion, 3 years old.—1, Jas. D. Cox.

Stallion, 2 years old.—1, Randolph Cox.

Brood mare with foal.—1, R. A. Snowball.

Filly, 3 years old.—1, R. A. Snowball.

Filly, 2 years old.—1, R. A. Snowball.

Foal of 1912.—1, R. A. Snowball.

Stallion, any age, ribbon and silver medal.—1, R. A. Snowball.

Mare, any age, ribbon and silver medal.—1, R. A. Snowball.

Stallion and 3 of his get.—1, R. A. Snowball.

CLYDESDALE HORSES

Stallion, 4 years old and upwards.—1 and 3, McFarlane Bros; 2, R. A. Snowball.

Stallion, 3 years old.—1, R. A. Snowball; 2, McFarlane Bros.

Stallion, 2 years old.—1, G. C. Cossar; 2, Wm. O'Brien & Son.

Stallion, 1 year old.—1, Prescott Blanchard.

Brood mare with foal by her side.—1 and 2, Wm. O'Brien & Sons.

Filly, 4 years old.—1 and 3, R. A. Snowball; 2, W. W. Black.

Filly, 2 years old.—1 and 3, R. A. Snowball; 2, Wm. O'Brien & Sons.

Filly, 1 year old.—1, R. A. Snowball.

Foal of 1912.—1, Wm. O'Brien & Sons.

Stallion, any age, diploma and Clydesdale Association silver cup.—McFarlane Bros.

Mare, any age.—diploma, R. A. Snowball.

Stallion and 3 of his get.—diploma, R. A. Snowball.

The Queen Hotel Silver Cup for best 5 horses, any breed, owned by exhibitor, was won by R. A. Snowball's Clydesdales.

PERCHERONS.

Stallion, any age.—1, Frank Ellis; 2, J. M. Wentzell.

Stallion, 3 years old.—1, Chas. Symes.

Stallion, 2 years old.—1, Albert Flemming.

Brood mare with foal by her side.—1, Albert Flemming.

Filly, 4 years old.—1, Chas Symes.

Filly, 3 years old.—1, Albert Flemming.

Filly, 1 year old.—1, Albert Flemming; 2, Chas Symes.

Foal of 1912.—1, Albert Flemming.

Stallion, any age.—diploma, Chas. Symes.

Mare, any age.—1, Albert Flemming.

Beef Cattle

SHORTHORNS.

Bull, 3 years old and upwards—1, C. A. Archibald; 2, R. A. Snowball.

Bull, senior yearling—1, R. A. Snowball; 2, I. M. Lovitt.

Bull, junior yearling— 1, R. A. Snowball.

Bull, senior calf—1, A. N. Griffin; 2, C. A. Archibald; 3, I N. Lovitt.

Bull, junior calf—1, I. M. Lovitt.

Cow, 3 years old and upwards— 1 and 3, C. A. Archibald; 2, I. M. Lovitt.

Cow, 3 years old—1 and 3, C. A. Archibald; 2, R. A. Snowball.

Heifer, 2 years old—1, 2 and 3, R. A. Snowball.

Heifer, senior yearling—1 and 3, I. M. Lovitt; 2, R. A. Snowball.

Heifer, junior yearling—1 and 2, R. A. Snowball; 3, I. M. Lovitt.

Heifer, senior calf—1, A. N. Griffin; 2, R. A. Snowball; 3, C. A. Archibald.

Heifer, junior calf—1 and 2, C. A. Archibald; 3, I. M. Lovitt.

Champion Bull—Diploma— C. A. Archibald.

Champion Female—Diploma— A. N. Griffin.

Best 3 animals, get of one bull—1, A. N. Griffin; 2, C. A. Archibald.

Best 2 animals, progeny of one cow—1, R. A. Snowball; 2, C. A. Archibald.

Best Breeder's Herd—1, R. A. Snowball; 2, I. M. Lovitt.

Best Graded Herd—1, C. A. Archibald; 2, R. A. Snowball.

HEREFORDS.

Bull, 3 years old and upwards— 1, W. W. Black; 2, Wm. O'Brien & Sons.

Bull, junior yearling—1, Thos. Aylward.

Bull, senior calf—1, W. W. Black.

Bull, junior calf—1, W. W. Black.

Cow, 4 years old and upwards—1, W. W. Black.

Cow, 3 years old—1, W. W. Black.

Heifer, 2 years old—1, W. W. Black.

Heifer, senior yearling—1, W. W. Black; 2, Wm. O'Brien & Sons.

Heifer, junior yearling—1, W. W. Black; 2, Wm. O'Brien & Sons.

Heifer, senior calf—1, W. W. Black.

Heifer, junior calf—1, W. W. Black.

Champion Bull—Diploma—W. W. Black.

Chamption Female—Diploma— W. W. Black.

Bull and 3 of his get—Diploma— W. W. Black.

Female and 2 of her offspring— W. W. Black.

Breeder's Aged Herd—1, W. W. Black.

Breeder's Young Herd—1, W. W. Black.

DEVONS.

All the first prizes in this class went to Wm. A. Pinkey, without competition.

GRADE BEEF CATTLE.

Cow, 4 years old and upwards— 1 and 2, W. W. Black; 2 and 4, Wm. O'Brien & Sons; 5, C. S. Congdon.

Cow, 3 years old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, C. S. Congdon.

Heifer, 2 years old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, C. S. Congdon.

Heifer, 1 year old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, Thos. Aylward.

Calf, under 1 year—1, W. W. Black; 2 and 3, Wm. O'Brien & Sons.

Steer, 3 years old—1, C. S. Congdon; 2 and 3, Wm. O'Brien & Sons.

Steer, 2 years old—1, C. S. Congdon; 2 and 3, Wm. O'Brien & Sons.

Steer, 2 years old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, E. S. Congdon.

Steer, 1 year old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, Thos. Aylward.

Calf, under 1 year—1, Wm. O'Brien & Sons; 2, W. W. Black; 3, Thos. Aylward.

Herd, consisting of 4 females, over 1 year old—1, W. W. Black; 2, Wm. O'Brien & Sons; 3, C. S. Congdon.

Cow and 3 of her progeny— Diploma—W. W. Black.

FAT CATTLE.

Ox or Steer, 3 years old—1, W. W. Black; 2, C. S. Congdon.

Steer, 2 years old—1, W. W. Black.

Steer, 1 year old—1, W. W. Black.

Cow or heifer, 3 years old—1 and 2, W. W. Black; 3, C. A. Archibald.

Heifer, 2 years old—1 and 2, W. W. Black; 3, C. A. Archibald.

Heifer, 1 year old—1 and 2, W. W. Black.

Heifer calf—1, W. W, Black; 2, C. A. Archibald.

Pair Fat Cattle, over 3 years old—1, Wm. O'Brien; 2, C. S. Congdon.

Pair Fat Cattle, under 3 years—1, W. W. Black; 2, Wm. O'Brien & Sons.

WORKING OXEN AND STEERS

Pair, 4 years old and over—1, C. S. Congdon; 2, Wm. O'Brien & Sons; 3, Thos. Aylward.

Pair, 3 years old—1, C. S. Congdon; 2, Victor W. Aylward.

Pair, 2, years old—1, C. S. Congdon; 2, Thos. Aylward.

Dairy Cattle

AYRSHIRES.

Bull, 3 years old and upwards —1, McIntyre Bros.; 2, M. H. Parlee; 3, Prescott Blanchard.

Bull, 2 years old—1, Allison McDonald.

Bull, senior yearling—1, McIntyre Bros.; 2, M. H. Parlee; 3, Easton Bros.

Bull, junior yearling—1, McIntyre Bros.

Bull, senior calf—1, Prescott Blanchard; 2, McIntyre Bros.; 3, Retson Bros.

Bull, junior calf—1, M. H. Parlee; 2, McIntyre Bros.; 3, Easton Bros.

Cow, 4 years old and upwards— 1 and 3, McIntyre Bros.; 2, C. A. Archibald.

Cow, 3 years old—1, Prescott Blanchard; 2, McIntyre Bros.; 3, Retson Bros.

Heifer, 2 years old—1, Easton Bros. 2, McIntyre Bros.; 3, Retson Bros.

Heifer, senior yearling—1, McIntyre Bros.; 2, Easton Bros.; 3, Prescott Blanchard.

Heifer, junior yearling—1, McIntyre Bros.; 2, Prescott Blanchard; 3, Retson Bros.

Heifer, senior calf—1, McIntyre Bros.; 2, Prescott Blanchard; 3, Retson Bros.

Heifer, junior calf—1, McIntyre Bros.; 2, Easton Bros.; 3, M. H. Parlee.

Champion Bull—Diploma—McInyre Bros.

Champion Female—Diploma— McIntyre Bros.

Four animals, get of 1 sire—1 and 2, McIntyre Bros.

Two animals, progeny of 1 cow—1, McIntyre Bros.; 2, Prescott Blanchard.

Breeder's Aged Herd—1, McIntyre Bros; 2, M. H. Parlee; 3, Prescott Blanchard.

Breeder's Young Herd—1, McIntyre Bros.; 2, Prescott Blanchard; 3, Easton Bros.

JERSEYS.

With the exception of second prize on bull, 2 years old, which went to Blake Bros.; all the first prizes in the Jersey class went to H. S. Pipes & Sons.

GUERESEYS.

Bull; 3 years old and upwards— 1, H. W. Corning; 2, Jas. McKenzie.

Bull, 2 years old—1, H. W. Corning; 2, A. H. Snide; 3, Roper Bros.

Bull, senior yearling—1, Hugh A. Dickson; 2, Roper Bros.; 3. D. G. McKay & Sons.

Bull, junior yearling—1, T. D. Blaikie; 2, John McDonald; 3, Roper Bros.

Bull, senior calf—1, H. W. Corning; 2, John McDonald; 3, Roper Bros.

Bull, junior calf—1, H. W. Corning; 2 and 3, D. G. McKay & Sons.

Cow, 4 years old and upwards— 1, Roper Bros.; 2, H. W. Corning; 3, H. A. Dickson.

Cow, 3 years old—1, H. A. Dickson; 2, John McDonald; 3, H. W. Corning.

Heifer, 2 years old—1, Roper Bros.; 2, D. G. McKay & Son; 3, H. A. Dickson.

Heifer, senior yearling—1, Roper Bros.; 2, 3, and 4, H. W. Corning.

Heifer, junior yearling—1 and 2, Roper Bros.; 3, H. W. Corning.

Heifer, senior calf—1, Roper Bros.; 2 and 3, H. A. Dickson.

Heifer, junior calf—1, H. W. Corning; 2 and 3, Roper Bros.

Champion Bull—Diploma— H. W. Corning.

Champion Female—Diploma— Roper Bros.

Bull, and 3 of his get—Diploma—H. W. Corning.

Female, and 2 of her offspring— Diploma—Roper Bros.

Breeders' Aged Herd—1, H. W. Corning; 2, Roper Bros.; 3, D. G. McKay & Son.

Breeders' Young Herd—1 and 3, H. W. Corning; 2, Hopper Bros.

(Continued on page 849)

Canning Vegetables in the Home.

One of the many problems that confront the housewife is the supply of vegetables for her table during the winter months. "What can I have for dinner today" is a question often heard. Since the advent of the modern greenhouse and the forcing the vegetables under glass fresh vegetables can usually be found at any time in the markets of the large cities. But the cost of forcing vegetables or growing them out of season is and will continue to be very great. This makes the price so high as almost to prohibit their use by people of moderate means, except as a luxury. A healthy diet, however, must include vegetables, and therefore the housewife turns to canning goods as the only alternative. These are sometimes poor substitutes for the fresh article, especially the cheaper commercial grades, which necessarily lack the delicate flavor of the fresh vegetable. There is practically no danger however, from contamination from tin or other metals, providing the containers are made of proper materials and handled carefully. In some cases the proper care is not taken in packing vegetables for market. The decayed and refuse portions are not so carefully removed as they should be and the requisite degree of cleanliness is not observed in their packing. Happily, however, such carelessness is not general.

Every housewife may run a miniature canning factory in her own kitchen, and on the farm this is especially economical and desirable, the economy being less pronounced in the case of city dwellers, who must buy their fruits and vegetables. Enough vegetables annually go to waste from the average farm garden to supply the table during the entire winter. But, usually the farmer's wife cans her tomatoes, preserves her fruits, and leaves her most wholesome and nutritious vegetables to decay in the field, under the impression that it is impossible to keep them. This is a great mistake. It is just as easy to keep corn or string beans as it is to keep tomatoes, if you know how.

Sweepstakes Clydesdale Mare at the 1912 St. John Exhibition.
Owned and exhibited by R. A. Snowball, Chatham, N. B.

THE SCIENCE OF STERILIZATION

The great secret of canning or preserving lies in complete sterilization. The air we breathe, the water we drink, all fruits and vegetables, are teeming with minute forms of life which we call bacteria, or molds of germs. These germs are practically the sole cause of decomposition or rotting. The exclusion of air from canned articles, which was formerly supposed to be so important, is unnecessary provided the air is sterile or free from germs. The exclusion of air is necessary only because in excluding it we exclude the germ. In other words, air which has been sterilized or freed from germs by heat or mechanical means can be passed continuously over canned articles without affecting them in the least. If a glass bottle is filled with some vegetable which ordinarily spoils very readily—for instance, string beans—and, instead of a cork, it is stoppered with a thick plug of raw cotton and heated until all the germ life is destroyed, the beans will keep indefinitely. The air can readily pass in and out of the bottle through the plug of cotton, while the germs from the outside air cannot pass through, but are caught and held in its meshes. This shows that germs and their spores or seeds are the only causes of spoilage that we have to deal with in canning.

Germs which cause decay may be divided into three classes—yeasts, molds, and bacteria. All three of these are themselves plants of a very low order, and all attack plants of a higher order in somewhat the same way. Every housewife is familiar with the yeast plant and its habits. It thrives in substances containing sugar, which it decomposes or breaks up into carbonic acid and alcohol. This fact is made use of in bread-making, as well as in the manufacture of distilled spirits. Yeasts are easily killed, so they can be left out of consideration in canning vegetables. Molds, like yeasts, thrive in mixtures containing sugar, as well as in acid vegetables, such as the tomato, where yeasts or bacteria readily grow. Although more resistant to heat than yeasts, they are usually killed in the temperature of boiling water. As a general rule, molds are likely to attack jellies and preserves and are not concerned with the spoiling of canned vegetables. The spoiling of vegetables is due promarily to bacteria.

Bacteria are also much more resistant to heat than yeasts. They thrive in products like milk and in meats and vegetables rich in protein, such as peas, beans, etc. All known species of molds require air in which to work. This is not true of bacteria, certain species of which will live and cause vegetables to decompose even when no air is present. When these particular species are present the exclusion of air is no safeguard against decay, unless the vegetable is first thoroughly sterilized. Bacteria are so small that they can only be seen with a microscope, and they reproduce themselves with amazing rapidity. One bacterium under favorable conditions will produce about twenty millions in the course of twenty four hours.

The reproduction of bacteria is brought about by one or two processes. The germ either divides itself into two parts, making two bacteria where one existed before, or else reproduces itself by means of spores. These spores may be compared with seeds of an ordinary plant, and they present the chief difficulty in canning vegetables. While the parent bacteria may be readily killed at the temperature of boiling water, the seeds retain their vitality a long time even at that temperature, and the newly formed bacteria will begin their destructive work. Therefore it is necessary, in order to completely sterilize a vegetable, to heat it to the boiling point of water and keep it at that temperature for about one hour, upon two or three successive days, or else keep it at a temperature of boiling water for a longer period of time—about five hours. The process of boiling upon successive days is the one that is always employed in scientific work and is much to be preferred. The boiling on the first day kills all the molds and practically all the bacteria, but does not kill the spores or seeds.

As soon as the jar cools, these seeds germinate and a fresh crop of bacteris begin work upon the vegetables. The boiling upon the second day kills this crop of bacteria before they have time to develop spores. The boiling upon the third day is not always necessary, but is advisable in order to be sure that the sterilization is complete. Among scientists this is called fractional sterilization, and this principle constitutes the whole secret of canning. If the housewife will only bear in mind, she will be able with a little ingenuity to can any meat, fruit or vegetable.

EXCLUSION OF AIR.

Even after sterilization is complete the work is not yet done. The spores of bacteria are so light that they float about in the air and settle upon almost everything. The air is alive with them. A bubble of air no larger than a pea may contain hundreds of them. Therefore it is necessary after sterilizing a jar of vegetables to exclude carefully all outside air. If one bacterium or one of its spores should get in and find a resting place, in the course of a few days the contents of the jar would spoil. This is why the exclusion of air is an important factor, not because the air itself does any damage, but because of the everpresent bacteria.

All of this may seem new-fashioned and unnecessary to some housekeepers. The writer has often heard it said: "My grandmother never did this, and she was the most successful woman at canning that I ever knew." Possibly so, but it must be remembered that grandmother made her preserves—delicious they were, too—and canned her tomatoes, but did not attempt to keep the most nutritious and most delicately flavored vegetables such as lima beans, string beans, okra, asparagus, or even corn.

SO-CALLED "PRESERVING POWDERS."

There are a great many brands of so-called "preserving powders" on the market. These are sold not only under advertised trade names but by druggists and peddlars everywhere. In the directions for use the housewife is told to fill the jar with the fruit or vegetable to be canned, to cover with water, and to add a teaspoonful of the powder. It is true that these powders may prevent the decay of the fruit or vegetable, but they also encourage uncleanly, careless work, and in the hands of inexperienced persons may be dangerous. While with small doses the influence may not be apparent in an adult in normal health, with a child or an invalid the effect may be of a serious nature. The proper way to sterilize is by means of heat, and as this can be done very easily and cheaply, the use of chemical preservatives in canning is not to be recommended.

KINDS OF JARS.

The first requisite for successful canning is a good jar. Glass is the most satisfactory. Tin is more or less soluble in the juices of fruit and vegetables. Even the most improved styles of tin cans which are lacquered on the inside to prevent the juice from coming in contact with the tin are open to this objection: While the amount of tin dissolved under these conditions is very small, enough does come through the lacquer and into the contents of the can to be detected in an ordinary analysis. While the small amount of tin may not be injurious, it gives an undesirable color to many canned articles. Tins cannot readily be used a second time, while glass with proper care will last indefinitely.

There are a great many kinds of glass jars on the market, many of them possessing certain distinct points of advantage. The screw-top, or Mason, is the one in most common use. Although cheap in price, these jars are the most expensive in the long run. The tops last only a few years and, being cheaply made, the breakage is usually greater than that of a better grade of jar. The tops also furnish an excellent hiding place for germs, which makes sterilization very difficult. An improved type of screw-top jar is fitted with a glass top held in place by a metal cover, which screws down over the neck of the jar. If the canning or sterilization is conducted properly, practically all of the air will be driven out of the jar by the steam. Upon cooling, this is condenced, a vacuum is formed on the inside, which clamps down the glass top against the rubber ring and seals the jar automatically. The metal cover can then be removed, as the pressure of the outside air will hold the glass top securely in place.

Another type of jar in common use require no rubber rings, but are fitted with a metal top, lacquered on both sides and having a groove around the lower edge. This groove contains a rubber which is melted during canning by the heat of the jar and forms a seal that takes the place of the rubber ring. These metal tops must be renewed each year, as it is necessary to puncture them in order to open the jar.

The most satisfactory jar that the writer has had any experience with has a rubber ring and glass top which is held in place by a single wire spring and is the kind used in the

(Continued on page 847.)

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

THE GRADE COW.

There has been a great deal of controversy on the part of a few with regard to the grade dairy cow. The majority realize that the grade is the logical stepping stone that leads to success with pure breds but there are some who believe that she should have no place in the consideration of those who are interested in pure bred stock.

The former president of one breed association has gone so far as to state emphatically in two annual addresses that no registered bull should be used on a grade herd. This has created considerable discussion, a majority of those interested taking exception to his statement.

A glance at the work that has been done in any of the dairy cow contests should be sufficient proof of the value of grade stock. In Iowa one grade Guernsey and one grade Jersey made phenomenal records while a Holstein grade made a very good showing indeed, winning for her owner a registered Holstein bull calf. In Wisconsin the same thing is true and if one follows other contests to the close he will find that the grade cows are doing a great deal for their owners everywhere.

The average production of the cows of this country is less than 200 pounds of butter-fat per year. In fact, in many of the states it is less than 150 pounds, all of which proves that the cows that are being kept on the American farms are not stock that have been bred and developed as milk and butter-fat producers.

It has not been so very many years since the market for these commodities was limited and the market for meat practically unlimited. Naturally the farmers were interested in selling that for which there was the greatest demand and they have been slow to recognize the better market for dairy products and the greater economy and success in producing dairy products. The change is being made but it will of necessity be gradual.

On the majority of the farms the herds are made up mostly of a class of stock not adapted to dairying. This accounts for the small annual yield. If the use of registered bulls on such cows were to be prohibited the progress of dairying would be hindered and the farmers would be left either with the stock that they now have or they would be forced to buy pure bred stock exclusively. The latter would be impossible in the majority of cases.

The grade cow is the young dairy farmer's aid that helps him to better things. She is worthy of all honor and she should be well cared for. She is sure to be the means that will make it possible for a large majority of the farmers to break away from the unprofitable cow and establish herds that are sure to bring better returns. The grade cow is demonstrating her ability every day and she is worthy of the esteem of every right thinking man.

THE IGNORANT DAIRY FARMER.

We mean the farmer who is ignorant of the production of his cows. Do you know that there is a great host of such farmers? Every one of our agents who take the cow censuses will tell you that the farmers they visited were in ignorance of the yield per cow of their herds until the agent worked it out from the creamery books. Then, in many cases, they were greatly astonished at the low figures. They supposed really that the earnings were more.

How can farmers rest content in such ignorance? It is the cause of all their lack of good profit.

One old farmer said to one of our cow census agents the other day:

"Do you know that that report you made me of my herd first made me mad but when I went to the creamery books I found you were right, I felt pretty foolish over such a condition of things. You won't catch me in that way again. I am going to have a good dairy herd."

This man's ignorance of what his own cows were doing shocked him into life and action, you see.

COMFORT CONDUCIVE TO THRIFT

Much of a stockman's material success depends upon the completeness with which he surrounds his animals with healthful comforts. By this means he turns nature's assets into cash capital. A farm animal can endure great privation, living on scanty feed, drinking polluted water and braving the bluster of winter's storms or the severity of summer's sun, but it does not thrive on such a regimen. Mere existence of cattle, sheep, hogs, or horses seldom results in profit. There are few circumstances now, even in winter, when it pays to permit young stock to drift along without gaining. At this time of year, when the summer's production of green feed is reaching its most valuable stage, with plant cells stored full of nutritious materials, stock must be surrounded with comforts permitting the best use of feed for growth or fattening.

Cattle cannot suffer thirst without depressing their vital functions; sheep cannot pine for shade without checking their gains; hogs cannot travel far in the heat for feed and water and still lay on fat rapidly, and horses cannot stamp and switch at flies incessantly and still preserve that equanimity of spirit and steady work which delight the driver. It is not the fight against hardship but the enjoyment of comfort which conduces to the profitable use of feed. The energy which is dissipated in overcoming obstacles to existence is forever lost, but it requires feed to supply it just the same.

If a man wants to think out a difficult problem he seeks the cool shade in summer or the cozy fireside in winter and selects an easy chair. There his mind is free to work without distraction. If he desires restful sleep he likewise seeks freedom from all unpleasant sensations. He cannot sustain the nervous strain and the expenditure of energy necessary to bear discomfort and at the same time do justice to his duties. It is even so with stock.

A breeder who studies the secrets of his charges knows how highly they prize comfort. When they are happy and contented they grow and gain. And their needs are not difficult to understand. A successful breeder writes from his half century of experience that animals can talk and be easily understood by anybody who loves them and is observing. He has found that happiness counts with cattle as with men.

THE SPIRIT OF IMPROVEMENT.

Go into any manufacturing establishment in this country and ask the president of it what is his attitude toward improvement or betterment of the methods used and he will tell you, after a searching look of surprise that you should ask him such a question, that his institution pays money liberally for experiments that are searching in that direction. The fact is manufacturers and managers of all kinds of business recognize at once the necessity of maintaign a hospitable spirit and attitude toward all effort to improve their methods and thus increase their efficiency and income.

Now go upon many of the farms, too many, and ask of the proprietor that question or propose to demonstrate to him the necessity on his part of improving his methods and what will his attitude be? Will he assure you that he sets aside a certain sum from his revenue, to experiment with and demonstrate better methods? Will he welcome any of your proposed better methops? Hardly.

Now in reality every farm is a factory, where the desired product is worked out from raw material. Half the time the methods are crude and unfit. The material —like feed for the cow—is wasted. The machines—the cows—waste a good part of the raw material given them, for the reason that they are not built right for their purpose. They do not do efficient dairy work and cannot.

If a like wastefulness prevailed among the manufacturers, that prevails among the farmers, bankruptcy would come in short order. What is lacking with the farmer? Is it not the same spirit, the same ambition for better methods? Would a farmer go along, year after year, milking poor cows—wasteful machines—if he had that spirit? Thousands of farmers have taken on that spirit, as their farms, their buildings and their herds will show. But many more thousands are, as yet, scarcely touched with its quickening influence. They groan under their unprofitable burden; their discontent is seized upon by demagogic politicians to seek after political remedies, which means always—put "me", the politician in office.

But the great sovereign remedy, the spirit of improvement, better knowledge, better methods, they reject. There is no other way known under heaven for the betterment of the condition of the farmer. No other spirit can lead him out of his difficulties. If this spirit abides not with him, he waits in vain.

Some Turnips.

Editor Maritime Farmer:

In the spring of 1911 cutworms destroyed about three-quarters of our planting of Wax Beans and to fill the vacancies in transplanted Swede Turnips ("Steele Briggs' Perfection") about 12 to 15 inches apart. The enclosed photo shows a fair sample of the crop. The average weight of those shown, which completely filled the barrel, was 20 lbs., the largest weighing 24 lbs.

The ground where these were grown is a sandy loam, although we did not

Turnips—Eight to the Barrel.

considee it then in verg good condition. It had been in pasture for a number of years, was plowed in the spring of 1910 and summer fallowed. In spring, 1911, it was again plowed and planted to beans as already mentioned, using barn manure in the drills. The transplanting was done quite early and the cultivator was run through occasionally until about the middle of July, when the green beans were picked and no further cultivation done. Considering the dry season, we were rather agreeably surprised at the growth of the turnips. —F. W. Shortt, Orchard Hill Farm, Kings Co., N. B.

The Nova Scotia Agricultural College Reaches its First Epoch.

Seven years have elapsed since the Nova Scotia Agricultural College formally opened, and a second seven years has begun. A week of years has seen great progress, and impelled by this, the College authorities are now preparing for another week of still more prosperous years. Seven years ago, the attendance at the regular and short course of the college totalled 85. This year 450 have answered to the call, and building which were formerly thought ample, were this year crowded to the limit. So the authorities have answered to the call of the country, and as a result, the sound of carpenters and masons is to be heard on the college grounds at Truro.

The following additional buildings are now under way: An ell is being added to the main building that will double its capacity. The main feature of this ell will be an assembly hall 88x60 feet, affording one-half more seating capacity than the former hall which had become too small to seat even a short course class, let alone the visitors who from time to time attended the sessions. Over this hall will be erected two class rooms, larger than any in the college at the present time. The basement will afford accommodation for the rapidly growing pure seed department under the control of the experimentalist at the college. Provinces are also being made in this basement for ample cloak rooms and shower baths for the students.

Horticulture, too, will receive its proper attention in the contemplated additions, for work has already begun on a new horticultural building with greenhouses attached, which will be an ornament to the college premises and will afford a much better opportunity to give this department the prominence which it deserves in the Province of Nova Scotia. In connection with the horticultural building, provision will be made for an entomological department with a glass house attached, where insects can be bred and studied at all times of the year. In this connection, the college authorities are just now negotiating for a Professor of Zoology who shall also be a Provincial Entomologist, and who will in addition to lecturing at the college, take charge of the work connected with the control of insect pests in the province.

Nor is the stock end, for which the college has been so famous, being neglected, for there is now well under construction a horse barn built on the modern principles in which will be houses the magnificent stallions and brood mares, as well as the farm horses which visitors to the college farm have so often admired.

To keep pace with all this, the colleg authorities have had to purchase extra land, and during the past year, the farm has been increased to the extent of forty acres.

It is most encouraging to observe these evidences of progress in this eastern institution, and we look for the next seven years to show even greater results than the seven years that have just passed by.

Records of a Dairy Herd for Five Years.

The Storrs Agricultural Experiment Station of Connecticut has recently sent out a bulletin entitled "Records of a Dairy Herd for Five Years." It is written by Prof. J. M. Trueman, the dairy husbandman of the station. For real rock bottom facts it should be an eye-opener to many farmers throughout the country.

The station herd, consisting of about 30 cows of milking age, has been carefully managed for the past five years, with the object in view of finding out exactly how much it costs to produce milk and butter, and how much profit or loss there was in the dairy business. The herd is composed of about one-third Jerseys, one-fifth Holsteins, one-fifth Guernseys and a few Ayrshires, all purebred. Half a dozen grade Holsteins make up the total number. These cows have been fed a standard ration of 25 pounds of silage, 12 pounds mixed hay and two pounds each of bran, cornmeal, gluten and cotton-seed meal. It is just about what many of the more up-to-date dairymen are feeding. The average cost of the grain fed to each cow for the five years was $74.06. This was charging the commercial grains at $30 per ton, hay at $16, and silage at $4 a ton. The pasture was charged at the rate of $10 a cow for each year outside of the grain and roughage fed. This makes a total of $84.06 a cow for feed. Although many farmers do not realize the full amount of their feed bill, the cost of maintenance outside of feeding is the really surprising point in this bulletin. The progress of arriving at a fair and accurate figure for this maintenance seems to be worthy of thought for every dairyman. The bedding cost was $5 per year. The keep of a bull for the herd amounted to $3. The actual labor cost was $33 a year. Interest in money invested on cow and barn was $6.75; taxes, $1.25, insurance, 40 cents. Decoration on each cow per year actually amounted to $13. Incidentals, such as ice, medicine, etc., were another $2. These several items make the total come up to $65.

That the cost for keeping a cow one year outside of food consumed will be as high as this figure will be denied by many farmers. A close reading of this bulletin, however, will do anybody some good. Nothing was done in the management of the herd that is not absolutely necessary on every farm producing milk in a sanitary condition. Every single item of expense is charged, however, and right there is how the amount totals up so high. Nobody knows how many farmers work year after year feeding unprofitable cows and making a living simply because they put no value on their own or their families' time. Another point of interest is that Prof. Trueman denies the truth of the oft-repeated statement that a cow's manure pays for the labor required to keep her. These cows produced manure of which the average yearly value was only $13.50.

Now with these figures before us of average food cost $84 and maintenance other than feeding $65, let us see what these cows did. They gave an average yearly production of 6378.7 pounds of milk testing 4.4 per cent. butter fat, or they would have produced an average of 324 pounds of butter a year if the milk had all been used for making butter. These figures show that with this herd of cows much above the average farm here and allowing $15 to each cow a year for her manure and a calf, there was an average loss of over $10 a year on each cow kept when the milk was sold at the door wholesale for four cents a quart. With butter at 30 cents a pound, if all milk had been used for this purpose, the loss would have been heavier. If the milk was sold at five cents a quart there was the small average yearly gain of about $20 on each cow.

In this herd, the same as in all herds, it was found there was a wide difference in individuals. The greatest annual net profit above all mentioned expenses were made by a Holstein heifer. If this cow's milk had been sold at five cents a quart during the last three years of the test she would have averaged $78.93 profit for her owner a year. If her milk had been made into butter, however, and this sold at 30 cents a pound, she would have proved a failure as a profit maker. One Jersey made a net profit from this butter source of $55.60 one year. Several cows showed an average loss from the butter standpoint of $20 to $30 a year. One cow showed a profit from milk at four cents a quart one year of $22. Two years later she showed a loss of over $60 from the same source. Several cows showed losses as high as $40 or $50 when their milk sold at five cents a quart. Such cows were of course not kept in the heard another year. At the completion of the five years there were only six of the original herd in the test. This shows the weeding that was done to get rid of the unprofitable ones as well as the natural decrease of the herd. These six cows show an average yearly profit from their milk at five cents per quart of $80 for each year of the test.

To my mind such a record as this should induce every farmer keeping cows to find out for himself what each animal is doing. Should an able-bodied man be willing to keep and care for a cow a whole year for $13 worth of manure? I am afraid too many are doing it. To the dairyman who already runs his business so he knows these things such a record should urge him to strive harder to improve his herd through breeding. The average of the offspring can be no higher than the average of the parents. This is a maxim. Only by breeding the very best cows to a bull of the finest breeding obtainable will the average production of the farm herds be raised sufficiently to make dairying a really profitable business.

Live Stock Diseases in Canada.

Glanders is now well under control in every province of the Dominion with the exception of Saskatchewan where a determined effort is being made to cope with this exceedingly troublesome disease. A large force of inspectors was detailed for constant duty in this province, with the result that 722 horses were found to be diseased, and were slaughtered, as compared with 525 in the previous year. The enormous importations of American horses and the rapid growth of settlement over a large area are the two most difficult factors in the eradication of the disease. In the other provinces the number of horses slaughtered, 123, was practically the same as the preceding year.

Dourine or Maladie du Coit has shown a gratifying decrease, the number of horses quarantined in Alberta, the province which first occupied the attention of the department in this connection, being reduced from 600 to 100, and the animals slaughtered from 40 to12. Outbreaks have unfortunately been detected in Saskatchewan, resulting in the slaughter of five animals, and every effort is being made to eradicate the disease which, from its insidious nature, is most difficult of detection. Dr. Watson, one of the Pathologists of this branch, who has devoted a great deal of his time to the study of this disease at the Lethbridge Quarantine Station, has quite recently returned from a visit to the continent, where he familiarized himself with the most modern and improved technique for the diagnosis of this treacherous disease. With the knowledge thus gained, and the advantage derived through this opportunity of comparing his diagnostic methods with those of continental authorities, it will now be possible to arrange to put into practical effect the latest determinative methods for the detection of dourine in infected animals which show no manifestations of disease.

Mange of horses and cattle still demands attention in the range country, where the facilities for transmission of the disease are so apparent among animals running at large. Satisfactory progress is being made and I have every hope of being able to reduce the infected area, which are under quarantine restrictions, in the not far distant future.

Sheep scab shows a gratifying decrease, the only outbreaks during the year being in the Province of Quebec, where 41 animals were found to be affected. The animals comprising these outbreaks grazed together on the same pasture during the summer months, which limited very materially the infected area. The various premises where they were housed during the winter season have been repeatedly visited, inspected and thoroughly disinfected. The most stringent precautions were taken to ensure the prompt eradication of this disease, as well as to prevent the possibility of spreading infection. Sheep imported are closely watched, and every precaution taken to guard against the introduction of the disease from outside our boundaries.

Hog cholera has, I regret to say, made its appearance to a considerable extent in all the provinces west of Quebec, the infection having been introduced in every case by the feeding of hogs on uncooked garbage and hotel swill. 4,247 hogs were slaughtered, as compared with 1,346 during the previous year, most of these being in Ontario and Manitoba. In view of the source of infection of these outbreaks it was found advisable to amend the Hog Cholera Regulations, with a view to restricting the feeding of raw garbage. Compensation may now be forfeited in outbreaks traced to this cause, in cases where the owner persists in feeding this undesirable material after having been duly warned. All possible steps are now being taken to advise hog owners to thoroughly cook garbage before feeding, which I hope will have the desired effect of

(Continued on page 854)

HORTICULTURE.

Fall vs Spring Spraying.

Our eastern fruit growers sometimes ask why fall spraying of apple orchards, which is being largely practiced, I believe in British Columbia and the western states and to a small extent in some of the eastern states has neither been recommended nor practised in Ontario. It is because we have found in Ontario that our present method of spraying, if thoroughly done, gives us almost perfect control both of insect pests and of diseases. Therefore it is not necessary for fruitgrowers to make an extra application in the autumn after the leaves are all or nearly all off. To do so would mean a good deal of inconvenience, and would greatly increase the cost and labor of spraying, thereby lowering the profits of apple growing and discouraging the growers. Our aim is to secure the best results in the easiest, most practical and economical way.

If the fall application could take the place of our first spring application just before the buds burst, any person who found it more convenient to spray in the fall than in the spring might do so. But we cannot see how it is possible to do this, because the application is not made until the leaves have nearly all fallen, and by this time it is usually so cold that all growth, both of the trees and of the diseases that attack them has ceased; nature is, so to speak, dormant, or nearly so, and remains this way until the warm days of spring renew activity.

Fall spraying cannot destroy all the spores of disease, for many of them are enclosed in little protected pustules on the bark or leaves or fruit, and these often do not open until spring; moreover, in the spring the wind will bring spores for long distances, and these will lodge on the trees. By this time all the fall spray will have been washed off the trees, hence the early spring application will be just as necessary as ever to keep off our Ontario diseases. This is especially true of Black Rot Canker, which spreads in spring to a very large extent. To ward it off it is very important that before growth begins in the spring the bark of the trunk and main branches be thoroughly covered with lime-sulphur so that any wounds or winter injured areas may not afford lodging places where this fungus can germinate and establish itself.

So far as Apple Scab is concerned, neither the fall nor the early spring application seem necessary for control, though they might help slightly. The important sprays for it are (first) the one just before the blossoms open, and (second) just after the blossoms have fallen, and in very moist districts or in wet or foggy weather a third one about two or three weeks later.

INSECT CONTROL.

From the standpoint of the control of insects it is probable that fall spraying would give fairly good results though I do not see how it would be quite so effective as the early spring spray belore the buds burst. The main insects controlled by this spray are of course Oyster-Shell and San Jose scales and Blister Mite. A number of other insects are partially controlled by it but not entirely. In my experience it is a very desirable matter in the control of scale insects that the spray should remain on the tree as long as possible in the spring so that it will be there when the young insects appear. In this way, it seems to destroy a large number of these delicate little creatures. This could not take place if the application had been made in autumn as it would be washed off. Some claim that fall spraying is more effective than spring spraying against scale insects, but they have not been able so far as I know to demonstrate this, and the very opposite seems to be the case. We should remember, too, that winter itsell destroys over fifty per-cent. of most of our hibernating insect enemies, so that they are weakened greatly by the time the spring application is made.

WESTERN CONDITIONS.

Why then is fall spraying practised and advocated so strongly in the Pacific States and in British Columbia? It is, so far as I can discover, chiefly to keep under control a very troublesome fungus disease known as Apple Anthracnose which causes numerous destructive cankers on the smaller branches and twigs. The spores of this disease spread in the autumn and germinate during or shortly after the fall rains. Therefore to prevent their germination the plant pathologists recommend that the trees be sprayed about the time these rains are due, which seems to be early in October, and again as soon as the leaves fall or the crop is off. We have no Apple Anthranose disease in Ontario. It is believed that the earlier of these applications helps to prevent fresh attacks of apple scab in autumn, but it is not claimed by such a reliable authority as Prof. Cordley, of Oregon, that this alone will control apple scab for the rest of the season. He practises the same spring and summer sprayings as we do.

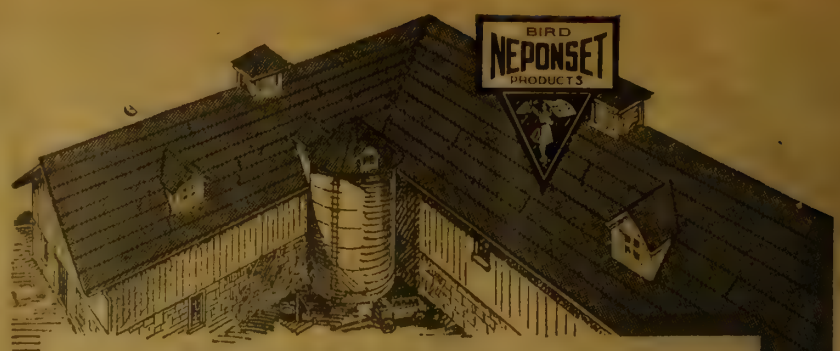
Thus, the main reason for fall spraying in the west, does not exist in Ontario. We should, moreover, remember that the climate of the Pacific coast is murh different from ours, and what may be necessary there may not be either necessary or desirable here. No harm, of course, could come from fall spraying in Ontario and anyone desiring to test it is running no risk. It certainly destroys many of the insects that a spring application would kill, and where an orchard is badly infested with Blister Mite or San Jose Scale or Oyster-shell Scale, it could be practised with much benefit until these were brought under control, but its proper place, in my opinion, is to supplement in this way and not to displace the early spring application. The proper mixture to use is lime-sulphur of the ordinary spring strength, without any arsenate of lead.

We should not forget that any system of spraying can be made more effective by proper pruning of trees and by careful cultivation of the orchard in the early part of the season, followed by a cover crop to prepare the wood for winter. These things help to make the trees themselves healthy, and allow free circulation of air and plenty of sunlight, all of which are important in the control of insects and diseases. The destruction of fallen fruit by hauling it to the evaporator or in any other way, is one of the best things that can be practised if we want clean apples.—L. Caesar, O. A. C., Guelph, Ont.

Thick Necks in Onions.

If the onions are making a large growth, but with large thick necks, large tops and poor bulbs, some of the most likely causes may be, too much water, improper soil conditions for onions, and poor seed.

In humid regions, if onions are grown on low wet land, having plenty of fertility, and the season happens to be rather wet, there is considerable likelihood that many of the onions will have large tops and thick necks. It seems that the use of so much water in irrigation could reasonably be expected to give the same result.



A Good Roof is a Good Investment

If you were to sell your farm you couldn't get as much for it if your buildings were run down and had leaky roofs. The farmers who keep things up in good shape are buying

NEPONSET PAROID ROOFING

The Real Rival of Best Shingles

because it is an investment. Gives you adequate fire protection. Cuts out repair bills and lasts as long as shingles or any other standard roofing material.

In one town the leading railway station has been covered with NEPONSET Paroid twelve years—painted once. The freight station has been covered with NEPONSET Paroid for eleven years.

Equally long records have been made on farm barns like your own. NEPONSET Paroid is the roofing you *know* will last. Be *sure* to buy it next time.

Send for name of the NEPONSET dealer and

NEPONSET
Proslate Roofing
makes a handsome red or green roof for houses.

Another trouble that may occur in some of the Western soils is that of the soil becoming hard after irrigation and preventing the proper development of the bulbs, and having other unfavorable effects which might increase a tendency toward thick necks. Soils which become hard after watering are best irrigated from deep furrows which are not allowed to become full, so that the water will rise to the surface by capillarity. To accomplish this would, of course, add much to the labor of irrigation. Such soil should be cultivated as soon after irrigation as the conditions will permit in order to keep the surface loose. It might be better not to attempt to grow onions on such soils. The trouble with soils of this character is insufficient vegetable matter in their composition. If alfalfa and other leguminous crops are grown on them their condition will be very much improved. They will become looser, much easier to handle, will not be so likely to suffer bad effects from irrigation, and will be in more favorable condition for the growth of subsequent crops.

Another factor that may cause onions to produce thick necks is that of allowing them to become very dry, perhaps for a considerable time, then giving an unusually heavy irrigation, which keeps the ground soaked up for some time. The plants after having been seriously checked in their development, which in itself has a tendency to prevent them from taking their proper course in development, shoot up at an unusually rapid rate when the water does come. Then in case an excessive quantity of water has been supplied, and the soil happens to be of a heavy nature so that the oversuppl y
that the over supply is retained for some time, the rapid growth of the onion which first took place may continue too long and thick necks be the result.

A partial explanation of the inability of onions to resist dry spells as compared with other crops is the fact that they are much shallower rooted than most other crops.

The matter of seed is also of considerable importance. Poor, cheap seed is much more likely to produce many thick necks than a good grade of seed' Some seed growers plant, for the production of seed, all bulbs, regardless of whether they have any bad tendencies or not. If many of the bulbs have a tendency to produce thick necks than an even larger proportion of the seed will have that tendency. Such seed will, of course, be poor seed. It can be sold at a low price because the expense of growing it has been low as compared with the cost of producing good seed. It costs money to sort out and discard onions which have bad tendencies when planting them for the production of seed, not only for the labor of sorting, but for the loss of the onions which are discarded. Such seed will obviously cost more to produce than poor seed.

Care of Plants.

Water is the conveyer of food to the plant. If this moisture is permitted to escape from the surfare by evaporation, it leaves the plant food at the surface. This food cannot nourish plants, because it is out of the range of their feeding roots. If the course of the moisture is through the plants, there is created a moisture current towards the roots, and the plant food is carried where it can be used to advantage. It will therefore appeal to any thinking person that measures should be adopted to prevent this moisture from being lost by evaporation.

The most practical and effective method is to establish and maintain a surface mulch of fine soil. By frequent use of implements of tillage which loosen the soil to a depth of two or three inches. So long as this mulch remains dry and loose, it serves its purpose well; but after each shower a crust will form, destroying the mulch, making a direct capillary connection between the lower moist earth and the atmosphere, which in a measure serves a purpose similar to a leak in a pail. The thing to be done, then, is to stop the evaporation leak by again breaking up the crust and creating the surface mulch by cultivation.

Valuable FREE BOOK
for the Asking—Write today

THE picture above illustrates how you can, at a small expense, by erecting frame work and covering the roof and sides with *Certain-teed* Rubber Roofing build a protection against rain, chilling winds and boiling sun and keep your stock in good condition.

Send today for valuable Free Book which tells about the many ways you can use this weather-proof, easy-to-lay Ready Roofing that comes in both rolls and shingles—guaranteed for 15 years.

The Toad as a Bug Destroyer.

Science offers a new solution for the bug problem. It is to employ in its professional capacity, so to speak, the toad—the ordinary hop-toad of the field and garden—as an insect destroyer.

In this business the humble toad is unequalled by any other living animal. He is the greatest bug exterminator in the world. It is entirely practicable to utilize his service on an extensive scale, employing him systematically as an ally to keep in check the insects which levy an annual tax of more than $8.000.000 upon our agricultural resources.

There is no reason why the farmers of the country should not hatch and rear their own supply of toads for local services. With a pond of even a small pool insured against drying up during late spring the creatures will breed of their own accord in any desired numbers up to the limit of the food supply available in the shape of insects. But one thing absolutely essential is that they shall be protected against their natural enemies, and by no means the least destructive of their enemies are small boys, who through mere thoughtlessness kill toads whenever they get a chance. It is estimated that an average toad is worth to the farmer $5. a year for the cut-worms alone which it destroys. But this is only one item. The amount a toad will eat is astonishing. A large specimen has been known to devour a hundred rose beetles at one single meal. One toad needed seventy-seven myriapods—the common household centipede—to satisfy his appetite another fifty-five army worms and yet another sixty-five gypsy moth caterpillars. Still another toad was seen to eat thirty-five large, full grown celery worms in three hours, while another accepted eighty-six flies fed to him in less than ten minutes.

It is a common thing when the occupants of an ant's nest are swarming and the insects are emerging in large numbers to see an enterprising toad sit at the entrance of the burrow and snap up every ant that comes out. The slaughter he accomplishes under such circumstances is frightful. But of course most ants are not reckoned as insects injurious to man; and the toad unquestionably destroys some species which are beneficial to the farmer. Upon the whole he is immensely useful, devouring countless numbers of the very worst bug foes of the crops.

Cultivate the Late Cabbage.

The late cabbage crop cannot well be cultivated too much. Cultivation and liberal supplies of available plant food are the main essentials to success after plants are set.

When time and work permits I cultivate my cabbage field every other day. I do not practice surface scratching as done by some growers, but get into the field with a double or a single shovel and dig down into the earth, turn it over, throwing it up against the stems, fairly shoveling the plants out of their place in the row.

When plants are set so they may be cultivated the cross way all the better. There is no excuse for weeds in the cabbage patch. Go over and cut out with hoe or cultivator when the plants are small.

I continue the cultivation until plants are well headed. If the horse or cultivator breaks off a few or even a good many of the outer leaves the damage is much less than the good done the crop by cultivation.

If too rapid growth is indicated by the heads starting to burst the trouble may be remedied by breaking the stalk over to one side and running a small moldboard plow along one side of the row, cutting off and exposing half of the root system, which will check the heads from bursting, while not injuring the vitality of the plant. —J. A. Bewson.

Fruit Growers' Reminders.

Canadian fruit growers are reminded in Bulletin No. 11, entitled "The Inspection and Sale Act, Part 9, and Amendment of 1907-8 and General Notes," that the Inspection and Sale Act prescribes the following:

1. That every closed package (box or barrel) must be plainly and indelibly marked with

(a) the name and address of the packer,

(b) the name of the variety, and

(c) the grade.

2. That the word "Fancy" or the numerals, No. 1, No. 2, or No. 3, must be used to designate the different grades.

3. That (a) Fancy grade must be perfect fruit.

(b) No. 1 grade must be 90 per cent. free from all defects.

(c) No. 2 must be 80 per cent. free from defects causing material waste, and containing no culls.

4. That the faced or shown surface to be the same grade of fruit as the rest of the package.

5. That the minimum size of the apple barrel is: 26½ inches between the heads, inside measure, a head diameter of 17 inches, and middle diameter of 18½ inches.

6. That the apple box must be 10 inches in depth, 11 inches in width and 20 inches in length, inside measurement.

NOTE.—The Act provides a severe penalty for the alteration, effacement or obliteration of marks on any package which has undergone inspection.

Meals!

LOTS of home baked bread, cake and pastry are always welcome. But baking is not *always* an easy job. Perhaps we can help you. Here is a truth backed by honest *proof*.

Help:

Regal Flour readily yields the *best quality* and the *utmost quantity* of bread per barrel of any flour in the world. Makes light, white loaves. And *such* meltingly flaky pastry.

Proof:

Try Regal once. If it is not just as good as we have promised, your dealer will return your money. We then have to pay him back. So unless you like Regal we lose completely. Isn't it fair to expect that Regal will mean easier, nicer meals?

THE LAWRENCE FLOUR MILLS CO. Limited

Fruit Drying House Profitable.

The construction of a permanent drying house is simple, or the principle such as I visited recently may be applied to a part of a building already on the farm. Briefly, the house was 15 feet square and much taller than square, that the heat might be longer in passing out. For perhaps 4 feet from the floor the space was unoccupied, thus permitting area for action, like keeping up fire, bringing in and distributing fruit on the screens, etc.

From this distance to the top it was a network of skeleton shelves for holding screens made of galvanized net tacked to slats. For coarse fruits like apples, screens made of slats only will do if spaces are left between them. The plan is to keep a high temperature that is dry in the house, and establish with it a draft, that all moisture may be elevated with the rising heat and passed out of the slatwork cupola at the top. More or less fire will have to be kept going, depending upon the weather. If cool, or warm and moist, enough heat must be maintained to rapidly dry the fruit. The top ventilator must be under control, that it may be opened more or less as needed. At the bottom, windows or shutters are regulated to correspond, that air may enter in greater or less volume.

The house I inspected belonged to a canning factory and was built for the purpose. Here all imperfect fruit was dried as well as the apple parings and cores. I was told that these were exported to countries where apples are rare and that from them was made apple butter and other commodities; that they brought a price per ton that well repaid the expense of drying and shipping. This constitutes a hint that should set the big apple farmer thinking. The tree trimmings and waste wood on every place will dry hundreds of bushels of second and third grade apples and peaches which may be prepared for the drier merely by quartering or by slicing or crushing, and spreading. Artificial drying is superior to natural, because of its speed and cleanliness, since it excludes flies and other insects.—Hollister Sage.

Careful Handling of Fruit.

Careful handling of the fruit that goes into storage is perhaps the most important part in establishing the keeping quality, if it is planned to hold it in cold storage. Fruit that is in any way injured in picking, packing or handling will have poor keeping qualities. In handling fruit we must avoid every possible chance of breaking the skin. As soon as the skin is broken, the fruit is at once infected with germs that spring into activity and begin to develop decay. So long as the skin is not injured there is little danger of decay.

The emptying of the fruit from utensils used in picking into the baskets, boxes or barrels should be carefully done. All baskets used for picking should be lined with cloth or burlap. Some apple growers use bags for picking, but they are not to be recommended, as the constant moving about of the fruit in the bag punctures the fruit with the stems and this is equally true with baskets unless care is taken in handling and emptying.

This is the season for saving fruits for winter use. Every home should have an abundant supply of canned, preserved and dry fruits. Then there are the preserves, the jellies, the jam, the pickles and the various other delicious articles into which fruits may be converted.

DAIRYING.

Variation in the Composition of Cows Milk With Advance of Lactation.

In the last few years a large amount of experimental work has been carried out to ascertain the influence of various factors upon the amount and quality of milk yielded by cows, and incidentally it has been clearly demonstrated that there is great variation in the composition of milk produced under ordinary conditions. Very little reliable information is, however, available as to the general trend of the changes in the composition of cow's milk throughout the whole course of lactation. A summary is therefore given of the information obtained on this point during three years from fortnightly tests of the milk of each cow in the herd at the experimental farm at Garforth. The records for the three years include seventy completed periods of lactation, of which fifty-seven have been utilized.

Variation in Yield of Milk.—Taking the averages of all the cows, the calvings of which were spread over the whole year, the records show a slight rise during the first few weeks followed by a steady and fairly regular fall. The average reached its maximum about the end of the first month, but in some cases the yield tended to rise for much longer than this, in one case for fully twelve weeks. The time of year at which the cows calved was found to have a considerable influence on the rate of decline in the milk yield. In the case of cows calving in the period from December to February, the yield fell steadily, but not rapidly until April, then remained fairly constant throughout May and June, after which it fell steadily again. The latter part of June or the beginning of July was the critical period also in the case of cows calving in the period from March to June. In the case of July calvers the yield fell steadily right through the lactation until in the May of the following year they were on pasture once more. Cows calving in the months August to November showed a fairly rapid drop to about an average yield, which was then surprisingly well maintained until in the following July the deficiencies of pasture began to produce their effects.

Taking the averages of the whole period the calvings that fell in the months December to February proved the most profitable in milk yield, and April calvings the least profitable. Of the thirteen lactations commencing in April not one lasted more that thirty-six weeks.

Variation in Percentage of Fat.—In most cases the percentage of fat fell somewhat rapidly during the first month or six weeks, then remained fairly constant up to the fourth or fifth month, after which a steady ride set in, which in some cases was greatly accentuated during the last week or two of lactation. In only one case did the percentage of fat fall steadily throughout the latter stages of lactation. The average percentage of fat was lowest in the fourth month after calving.

An analysis of the records showed considerable variation according to the time of year at which the cows calved. Winter calvers reached the lowest point in the fifth month; in the case of March calvers it was reached in the third month, and in the case of April calvers in the second month. In all these cases the worst time corresponded roughly with Summer calves (May to September) the first half of the pasturage season. differed from the others in that there was not so pronounced a change in the percentage of fat at any period, the range in the monthly averages being only from 3.82 to 4.25 per cent. As far as general conclusions can be drawn from the number of lactations investigated, it appears that the percentage of fat will generally be lowest in the first part ol the pasturage season, except in the case of cows which are far advanced in lactation when turned out in spring.

Variation in Percentage of Solids-not-Fat.—With regard to solids-not-fat, the records of individual cows show considerable differences, which is not surprising in view of the variety of substances included in the term. During the earlier stages of lactation the variations in solids-not .fat were similar during the first two months and then remaining fairly steady for three or four months. After this, however, the tendency was for the solids-not-fat to fall, though there was perhaps a slight rise during the last two months.

The fall in the percentage of the solids-not-fat during the second half of the period of lactation was due to the steady decrease in the amount of sugar after the first month or so; the variation in the proportion of albuminoids is precisely similar to that in the amount of fat, while the ash remains remarkably constant throughout the whole period.—From the Journal of the Board of Agriculture, June, 1912.

Will Cows That Freshen in the Fall Yield More Milk Than Those Freshening in the Spring?

This question, the writer or any other person cannot answer, and have the answer correct in different localities, and under different conditions. In South Dakota, and probably in other central west states, the writer feels safe in making the statement that a cow freshening in the fall will give more milv than the same or a similar cow will give when freshening in the spring.

This statement may be somewhat of a surprise to some of the readers as some consider the northwest unfavorable for dairy farming due to the long and rather hard winters.

A stage in dairy farming has been reached, when winter climatic conditions can better be controlled than can summer conditions. It is easier and cheaper to protect a dairy cow from excessive cold than it is to protect her from excessive heat.

Hot weather is undesirable for cows, but worst of all is that such weather is accompanied with cow pests of various kinds, such as flies in the daytime, and mosquitoes at night. In the writer's experience, there is nothing so effective in drying a cow as hot weather plus flies and mosquitoes.

True it is, that we now have fly repelling preparations that can be sprayed on the cows, and in that way alleviate the cows from flies during milking time and in part during the day. The writer has yet to find a substance which will keep the flies away over about an hour after it has been put on. These fly repellers are quite effective and practical to use on the cows in the barn just previous to milking; but they are less effective and practical for keeping the flies off during the whole day in the pasture. As to mosquito repellers, the writer has found nothing that can be used at a reasonable cost.

In addition, many pastures are short of good feed during a large part of the summer. This of course can be overcome by supplementing with silage or some soiling crop. Under average dairy farm conditions, fall, than when freshening in the this latter is not practiced.

The dairy farmers of the northwest are extremely busy with their crops during the summer months.. There is a strong temptation to neglect their cows during this part of the year. Every dairyman knows what this means when milking time comes. It means less milk.

The writer is fully aware that a cow freshening in the spring will yield a maximum amount of milk during the spring months when pastures are green, weather favorable and no mosquitoes and flies to trouble the cows. These conditions are however of short duration. When the un' favorable summer conditions come on, the cow drops off in her milk flow. When a cow once has dropped in milk it is difficult to get her back to her normal flow.

The final result is that the annual milk flow from a spring cow is less than when she freshens in the fall.

The dairy farmers of the northwest are rapidly getting wise to the use of silage as a cow feed. Thousands of silos are sold and built in South Dakota this year. With good silage as a succulent winter feed, a well ventilated, lighted, and comfortable barn and plenty of good care, the cow freshening in the fall will give a good uniform flow of milk under winter conditions. When the cow is turned in pasture, she will increase her milk flow. When the unfavorable summer conditions come on, she will go dry almost at once. This is desirable, as a cow should have about two months rest during the year. The time to give the dairy cow her vacation is when the farmer is busy harvesting his crop, and when the flies, mosquitoes, hot weather, and dry pasture will not let the cow do her best as a milk producer.

According to records on hand, the writer feels safe in saying that a cow in South Dakota and other states having similar conditions will yield at least 20 per cent. more milk during the year, when freshening in the spring. —C. Larsen, Professor Dairy Husbandry., South Dakota State College in Hoards Dairyman.

Standard

Sprays itself with oil all the time it's running

THE self-oiling system starts spraying the working parts of the "STANDARD" Cream Separator with oil the instant you start turning the crank. It stops oiling when you stop turning. There are no glass lubricators that demand continuous attention. The "STANDARD'S" oiling system looks after itself. The oil-proof and dust-proof casing, enclosing the working parts, prevents dust and dirt clogging up the machine and oil getting on to the floor.

The "Standard"

Because of the self-oiling system, the "STANDARD" Cream Separator runs easier. There is always a body of oil in the bearings—always oil between the teeth of the cog wheels when they mesh. This means that the cogs in the different gears are not subject to the ordinary wear. The less wear, the easier the Separator will run, and the longer it will last.

When changing the oil in the oil chamber, once every two or three months, cleanse the working parts by running a cupful of coal oil or gasoline through the machine a few minutes. That will keep your "STANDARD" running at highest efficiency. The self-oiling system is only one of the outstanding features of "the world's greatest separator." Others are described in our booklet. Write for a copy. It's well worth having.

Integrity in Farm Milk.

The sensational dailies delight to print stories about the illness or death of babies in the slums, laying the blame entirely to "impure milk." Now, why is it that milk-fed infants on the farm thrive, while babies in the city, fed on the same milk, pine away? To ask this question is to demonstrate the answer. The trouble was not in the milk as it left the farm. If the milk receives proper care in transit, if it is handled in a sanitary manner from the time it reaches the city until it is put into the household of the consumer, and if there it is properly taken care of, seldom will milk be responsible for any form of illness in either young or old. If city and state boards of health would direct their attention to the care of the milk from the time it leaves the farm until it is actually consumed, they would have much to learn.

Some years ago it was fashionable among a certain class of doctors and other sensation mongers to attribute the spread of tuberculosis to milk. This theory has been knocked into a cocked hat by showing that during the past half century, although the per capita consumption of milk in certain cities had more than doubled, deaths from consumption had fallen one-half.

There is hardly a producer of milk for market but what wishes to make a good, pure article; he wants to liver it to the railroad or peddler. But it is wicked to hold the producer responsible for any deterioration that occurs in the milk after it leaves the farm. The farmer is perfectly willing to go to any expense to make sanitary milk, even to the extent of tiled stables, provided he can get a price care for it in the right way, and de-

WINDSOR DAIRY SALT

Swept The Boards At All The Fairs

1911 was a triumph for Windsor Dairy Salt. Practically every prize for butter-making was won by someone who used Windsor Dairy Salt.

Those, who make their living out of their dairies, say that Windsor Dairy is their old standby. They always rely on it because they know it is pure—because it makes the richest, most delicious butter — because they win the prizes and get "Top prices" for their butter—when they use WINDSOR DAIRY SALT. 66D

GOVERNMENT EXPERT

Chooses

SHARPLES Tubular Cream Separators for His Three Farms

Like other shrewd farmers, Mr. Anson Groh, widely known agricultural lecturer employed by the Government, knows the money to be made in dairying. He has succeeded because he knows profit is of far greater importance than first cost. Like others making most money from dairying, Mr. Groh selected the Tubular in preference to all others because the Dairy Tubular contains no disks or other contraptions, has twice the skimming force of other separators, skims faster and twice as clean, pays a profit no other can pay. Mr. Groh says:

Preston, Ontario, May 28, 1912.—Some years ago we selected the Sharples Tubular. After a few years' use we found it necessary to get another separator for another farm and selected a No. 6. After several years' service of these two machines, we would not think of introducing anything else on our third farm, recently purchased. ANSON GROH.

Now you understand why owners of other separators are discarding their machines by carloads for Tubulars. Follow the example of Mr. Groh and the many others who have succeeded. Buy a Tubular for the sake of double skimming force, easy cleaning and all the profits.

Get quick attention by asking for Catalog 194

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

for the milk that will return 5 per cent on the added investment. It is high time that certain city officials and sanitarians quit libeling the farmer, unless they want to be haled into court and made to prove their statements.

Impure Salt in Butter.

The flavor of butter is often spoiled by the use of impure salt. This is especially true in ranch butter. After analyzing the flavor of many samples of ranch butter the writer has found bad flavors where undoubtedly the cause was due to impurities in the salt. Too often a very common grade of salt is used in salting butter on the ranch. In the creamery a good grade of dairy salt is more commonly used. These impurities may consist of organic filth or may be mineral in nature.

Magnesium chloride is the most common of an organic nature in salt which is liable to affect the quality of the butter, as compared with pure salt, sodium chloride, it does not dissolve as readily and has a bitter flavor. These two properties are both detrimental in the butter. The bitterness destroys the good flavor of the butter, and salt which does not go into solution requires that either the butter be overworked or that the salt be left in a gritty condition in the butter.

Other impurities in the salt such as specks of dirt not only injure the appearance of the butter but often imparts undesirable flavor and bacteria to the butter. The appearance of the butter goes a long way toward helping or destroying the sale of the butter. Then the dirt is liable also to have a bad effect upon the flavor of the butter. Flavor is the one quality which butter fat has over other fats and is that quality which causes it to sell at so high a figure above other common fats. If this good quality is destroyed the value of the butter is materially lessened.

Butter fat is too high priced and good dairy salt is too cheap to make it advisable to spoil the flavor of the butter by the use of an inferior grade of salt. Not only will the quality of butter be improved by the use of salt but there will also be less trouble in getting the salt dissolved and evenly distributed in the butter. The use of good dairy salt is one way in which much of our ranch butter could be greatly improved. If local dealers do not handle good pure dairy salt the same may be purchased from any of the leading dairy supply houses.

One Reason Why Holsteins are Popular

Editor The Maritime Farmer;—

Probably the most prosperous farmer in the rich county of Brant, Ont. is Mr. S. G. Kitchen. The ownership and direction of a half-dozen farms does not afford scope for his keen business instincts, and he is heavily interested in manufacturing and other organizations more or less connected with agriculture.

For years Mr. Kitchen owned a large cheese and butter factory and was a very close observer of the amounts of milk and fat supplied by his patrons in porportion to the number of cows kept. It did not take long to convince him that owners of Holsteins and Holstein grades were the men who were making the most out of their cows.

About seven years ago Mr. Kitchen purchased some 25 pure bred Holstein-Friesian heifers as the foundation of a working dairy herd. No effort has been made to sell stock, all the females being retained in the herd.

After trying nearly all the popular breeds, Mr. Kitchen is thoroughly satisfied of the superiority of the Holsteins as machines for profitably converting the rough fodders and other feedstuffs commonly found on Canadian farms into first class milk.

It has been his experience that, with the Black-and-Whites, ten out of twelve heifers will turn out to be excellent cows. With the other breeds the proportion is just about reversed, perhaps two out of twelve will turn out well. Other dairy farmers have had the same experience, and this very fact goes a long way toward explaining the extraordinary advance in popularity of the Holstein-Friesian breed during the last ten years.

Mr. Kitchen has investigated the milking Shorthorns in their English homes, and has tried dairying with Shorthorns in Canada. It is his opinion that it would be a great mistake to endeavor to again popularize this breed in the great districts now almost entirely given over to the special-purpose dairy cow.—G. W. Clemons.

Keeping a Cow From Sucking Herself.

A very satisfactory device to keep a cow from sucking herself is made as follows: Make two collars of hoop or strap iron, one to fit just back of the jaw, the other just in front of the shoulder, joining them with two or three small rods (¾ in. preferred) on each side, leaving it open in the bottom and fastening in place by bolts. It is effective and does not bother the cow except when fighting flies. It should not be made too long or too tight.—W. H. Thompson.

Special Purpose Cows.

Writing some time ago in the Breeders' Gazette, anent the subject dealing with special purpose cows, Walter A. Cook says:

"We want cows that are useful in life and we want cows that are useful when dead, but if we try to keep cows that are useful both in life and death, we are very liable to be led astray as far as finances go. That a cow must come to her "inevitable end" is true, but at that "time" she is not always in the best condition to use for beef. If we wait for her to reach that point we will most surely find that she is good for nothing but to fertilize the land."

Signs of a Good Gow.

A writer in a farm exchange cites what he is pleased to call the extra signs of a good cow. What do you think they are? He says they are; 1. An owner with a kind and sympathetic heart for a cow, a born love for the animals. 2. Comfort spelled in capitals at every turn. 3. A silo. 4. Plenty of good feed. 5. Giving the cow the right kind of a father. 6. Testing her and keeping a record.

All these signs, he says, belong to a good cow and a good cow thrives on them amazingly, so that if they are freely granted her she would be ashamed to be anything else than a good cow.

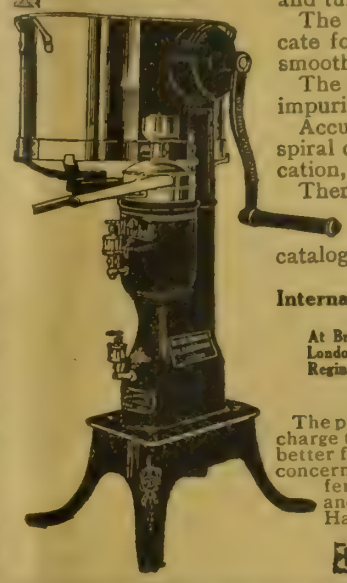
A Close Skimmer and Built to Last

THERE are two features that make a separator a good investment: close skimming and durability. Easy cleaning and easy turning are important, but not as important as the power to get all the butter fat and keep on doing it for many years.

I H C Cream Separators will make good under the most severe skimming test. If you will compare their construction with that of any other separator you will see why. Extra strong shafts and spindles, spiral cut gears, phosphor bronze bushings, thorough protection against dirt or grit getting into the working parts, and perfect oiling facilities, are the features that make these separators good for long service.

I H C Cream Separators Dairymaid and Bluebell

are close skimmers and built to last, and at the same time are easy to clean and turn. The reasons are these:



The interior of the bowl is entirely free from intricate forms of construction. Every part has a plain, smooth surface, to which dirt and milk do not adhere.

The dirt arrester chamber removes the undissolved impurities from the milk before separation begins.

Accurate designing and fitting of all moving parts, spiral cut gears, convenient crank, and thorough lubrication, make these separators easy to turn.

There are many other features worth your consideration. Ask the I H C agent handling these machines or write the nearest branch house for catalogue.

Removing Foreign Bodies From the Eyes.

Some weeks ago "Cornishman" wrote concerning a statement he had seen in Farm And Home relative to the cruelty associated with blowing a sharp powder into a bullock's eye to cut the film which grows over it when the caving or husk of oats gets into the eye. Something was said in the paragraph about putting some liquid in the eye, but the recipe was not given. He adds: "As I got a lot of cattle affected in this way, I should be delighted to hear of a more humane treatment."

We have not been able to find the note referred to, but have concluded, as the question is one of considerable importance, that it may be useful to say something about the best means of removing foreign bodies from the eyes. Cattle, of all animals of the farm, are the most liable to this trouble, and their liability is increased when they are brought into the yards, and they are fed with oat-straw, or the "cavings" and refuse of the thrashing machine is thrown to them to pick over and trample into muck.

The wind is apt to blow the husks about, and when a piece enters the eye, the tears and the "haw" are not equal to removing it as they remove particles of dust and dirt, because, being thin and flat, the husk adheres closely to the membrane covering the eyeball, and the "haw" in passing over it fails to pick it up. If allowed to remain there for any length of time, the "chaff" or "caving" sets up irritation and inflammation of the conjunctiva, and, unless at once attended to, this may be succeeded by opacity and ulceration of the cornea, and sometimes total blindness.

SYMPTOMS.

The first symptom observable is that of profuse weeping—tears running down the cheek, wetting and discoloring it, while there is an intolerance of light, which causes the animal partially or completely to close the lids. On examining the eye, there will be found an opacity of the cornea at the spot where the chaff has laid for any length of time. The "film" referred to by "Cornishman." This spot may vary from white to a bright yellow or deep red, and in cases of any standing the whole of the conjunctiva will be inflamed, and the "caving" encysted, or, as the cowman expresses it, "a skin grows over it." The eyeball is covered with a membrane which is a continuation of that lining the lids, and it is this membrane, called the conjunctiva, which first becomes inflamed.

The bovine, in common with other quadrupeds, has an appendage to the eye, which is popularly known as the "haw," and about the functions of the "haw" there unfortunately exists a good deal of misapprehension. Ignorance has even invented a disease of this indispensable appendage, and the "haw", when inflamed, has been brutally cut out. This cartilaginous and membranous structure—a part is embranous and the remainder of adenser material like cartilage—is known to anatomists as the cartilago nictitans, or membrana nictitans, and its office is to protect the eyeball by being suddenly projected as a guard, and to remove flies, insects, and other foreign bodies by being passed over the eye, acting as a sweeper, and carrying the offending particles towards the lachrymal duct.

TREATMENT.

But when we want to remove a "chaff" or similar body from a cow's eye we find this nictitating membrane rather in the way, for, on attempting an examination, the eyeball is retracted by a powerful muscle, which draws it back over the cushion of fat behind it, and the "haw" is protruded in such a manner as to hide the object of the search. Occasionally it may be detected by separating the lids with the finger and thumb, or partially everting the lids, but the rapid retracting of the eye and the protruding of the "haw" generally defeats the effort, and complicates the examination of those who do not possess both skill and patience, unless a solution of cocaine hydrochlorate is used to produce local anaesthesia. The cost of this remarkable drug restricts its extensive use, and it is not found in the farm medicine chest, but with it local anaesthesia can be produced in five minutes, and when insensibility is secured it lasts long enough to permit of even formidable operations on the eye without pain.

The method ordinarily adopted by the stockman are commonly wanting in success. He gets an assistant, who holds the bullock by the nose and horn, turning the injured eye uppermost and towards the light. When he comes to look for the chaff there is nothing of the kind to be seen—only a white globe covered with highly injected blood-vessels. If the visual portion of the eye is not so retracted and the chaff can be detected, the horse-hair or silk handkerchief he uses is not very efficient for removing a body that sticks so closely to the conjunctiva as an oat "caving" that has been in the eye for two or three days. A much better plan than this is for the assistant to hold the animal's head steadily in the natural position, not turning it toward the light, but rathes away from its direct rays.

The operator should then stoop down so as to get on to a level with the eye, and patiently watch his opportunity. Presently the retractor muscle will cease to act, and the membrana nictitans be withdrawn, and then, if the chaff is fairly central—as it generally is—he can, by a quick movement, touch it lightly with a forefinger previously dipped in Venetian turpentine. This being more adhesive than the membrane of the eye, the chaff wil, stick to the point of the finger. If it is found necessary to evert the lids, it can be better done in the position described, and removal can then be effected in the same way. Only a very small quantity of Venetian turpentine is necessary, and a pennyworth, if kept closely covered and in a cool place, will last for years. It is sufficient just to touch its surface with the tip of the finger, and a small pot of it should form part of the fodderman's equipment where straw or "cavings" are being fed or put into yard. A small quantity of cocaine solution greatly simplifies examination and removal, as the operation is then quite painless—an advantage where the case is of some standing. After the "chaff" has been removed much relief may be afforded, and the inflammation abated, by excluding the light, fomenting the damaged eye with a warm decoction of poppy-heads, and applying a little lead of zinc lotion.—Pateley Bridge in Farm And Home.

Fresh meat is always in demand for the farm home. Every farmer should raise a few pigs, a few calves and a few lambs to supply his table occasionally with fresh meat. Usually the surplus in warm weather, when it is a difficult matter to keep it, may be disposed of at a fair profit to your neighbors who are also desirous of having fresh meat occasionally. If a pasture be available, the cost of raising three animals will be small.

Disenfecting a Barn.

J. McD., Pictou, N. S.—I wish to disinfect my barns, which I have recently bought, so as to render them safe from any previous disease which may have existed in them. Will you advise me what to do and how to do it. I want to make it absolutely safe if possible.

Before disinfecting, the walls, ceilings, floors, and mangers, in fact, everything in the stable, should be thoroughly cleaned. There are a number of effective ways of disinfecting a barn. One method is as follows:

After thoroughly cleaning the barn, sprinkle all parts of it with a solution of some coal tar product which may be obtained from a local drug store. After this is done, thoroughly whitewash the ceiling, walls, mangers and floors. In preparing quick lime, add a pint and a half of water to each quart of lime, or by weight, 60 parts of water to 100 parts of lime. The result is hydrate of lime, a dry powder. One quart of this is mixed with four quarts of water. This mixture must be used immediately to have any germicidal power. It may, however, be held two or three days if kept tightly corked, but air-slaked lime, in a mixture of water and quick lime, that has been exposed to the air for several days, has no value as a germicide. This is due to the fact that the material becomes changed into the carbonate form of lime. It has been found very effective to add some of the coal tar products, such as zenoleum, to the lime mixture.

The best way to apply the lime is with a spray nozzle which is quicker and more economical than trying to put it on the walls, ceiling and floor of the barn with a brush. If the lime is applied with a spray nozzle it must be strained through a small wire sieve, for lumps will clog the nozzle unless it is strained.

Selecting the Dairy Sire.

A farm was visited a few days ago where half a dozen high-grade Holstein cows were being milked. They were fairly good cows, lacking in a few essential points. The past year's sale record showed an average of 6,000 pounds of milk per cow notwithstanding the fact that some were used on the farm. They were such cows as would respond to a grading-up process. Calves from them sired by a high-class bull would undoubtedly make dairy cattle of the profitable sort.

The bull in use on the farm was a sorry disappointment, a pure-bred Holstein and purchased for $25. He was undersized and lacking in type and all other essentials of a good dairy sire. The owner cannot with reason expect improvement through such a bull. No one seeing the bull would care to buy calves from that farm. The fact in itself that the bull is a pure-bred made him undesirable in at least one sense. He is more likely to transmit the undesirable characteristics that he posses than if he were a grade. Of course there is a possibility that some of the strong blood in his ancestry will reappear. However, chances of that are so small that they weigh very little in the balance against the almost certain transmission of qualities undesirable.

The owner may argue economy, saying that with a few cows he cannot afford to pay more than $25 for a bull. In his own small herd he expects to keep a bull long enough to secure about twenty calves. Now a first-class bull calf could have been purchased for $75. The additional cost would have been $2.50 upon each of the progeny. Certainly the value in the dairy or for sale would have been many times that difference. Then there is the ever-present opportunity to breed cows for nearby farmers who have only a few cows. No one would take a cow to the $25 bull except as a last resort.

It was quite different from another place visited not long ago. The owner of that farm possessed one pure-bred Guernsey heifer and three or four grades. Partly to gratify a personal desire for good ttock and partly to supply a good bull for the locality, he had purchased a $300 pure-bred Guernsey bull. His book showed that in one season he had bred more than fifty cows for his neighbors. At $3 per cow it would require only about three seasons for the bull to pay for himself and his keep. Indications were that a much larger number of cows would be taken to him during the next year.

A plan that is enabling small farmers to secure the use of a high-class bull is for several to co-operate in the purchase of a bull. The cost is reduced proportionately and the labor required in leading the cows away from the farm for service is more than offset by the decreased cost of keeping the bull. This plan is being followed very successfully in many places and is meeting with marked favor by those engaged in it and by every one who has had the opportunity to observe it closely.

Then the plan of leasing bulls for a season or part of a season is offering opportunity for many men to secure a high-class bull for service where it would be possible through no other means.

Improvement of common herds must come largely through the use of better bulls. Cows are to a large extent a fixed quantity and quality. with the use of a bull of superior merit improvement may be expected, especially if he is an individual that has been tried and proved satisfactory. With a bull of average merit no improvement can reasonably be expected while with an inferior one degeneration only will be the result.—H. E. NcCartney in the Breeders' Gazette.

Young pigs need skimmed milk, with other feeds, to stimulate rapid gains. The dairyman is favorably situated for raising hogs.

"INTERNATIONAL FLY WAY"
Prevents the Tremendous Loss from Flies
Flies cost the Farmers of Canada millions of dollars annually by retarding the growth or fattening of animals and by greatly reducing the production of milk by constantly annoying the animals all summer. Every farmer or stockraiser knows this statement to be true from his own experience.
Flies also cause a great loss of life by Spreading Diseases from farm to farm. "International Fly Way" will keep flies off your animals and give them perfect rest from these pestiferous insects, which will make you more money in a larger production of milk or much quicker growth of all animals.
SAVE YOUR STOCK
By Using
"INTERNATIONAL FLY WAY"
It is positively guaranteed to be effective in Driving Away Flies, Mosquitos, and other insects which worry stock and reduce their earning capacity. It is harmless to the hair and skin and will be found perfectly satisfactory when used according to directions.
We place our twenty years of reputation back of "International Fly Way," and ask you to test it on our positive guarantee.

Ewes at Breeding Time.

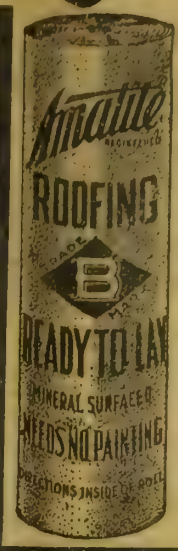
There are no flocks of ewes in which there are not some which need culling; old ewes in particular should be drafted without compunction, although there may be some favorites among them, while among the younger sheep those which are ill-formed, coarse, badly woolled, or wanting in vitality should make way for better sheep. Nor is it always advantageous to retain two-tooth ewes for breeding unless the best are exceptionally strong and in every way suitable for the work. By the time a flock has been so well overhauled that every undesirable ewe has been removed, it will be found essential to add to its number in order to make up for its reduction in size. There are always some flocks where good selections can be made, or, failing this, it is always possible to obtain the required ewes by purchase in the usual way, either direct from a first-class breeder, or through the medium of a dealer upon whom reliance can be placed. It is important to remember that the ram is of equal importance in the production of good stock to the whole of the ewes with which he mates. It is, therefore, essential to select the best that can be obtained with the means at command. A ram should be masculine but not coarse, of good frame but neither fat nor heavy in bone; he should carry a good fleece which has not been trimmed to fill the eye and to give him form which he does not possess; he should have good loins and legs, breadth of chest, a straight back, and carry all the points of the breed to which he belongs. Although there is no necessity to pay a fancy price, a farmer who requires good lambs should realize that he cannot obtain first-class rams for a few dollars a head.

Although it is sometimes regarded as imperative to feed breeding ewes high when they are put with the rams it is quite sufficient if by previous feeding their condition is good. It is, however, equally important to remember that breeding ewes—and the remark applies to sheep of all kinds—should be kept at this season from water meadows and swampy or wet land, both of which may be affected with flunke or the destructive Strongylus which we habe known to affect a whole flock, many o which have died. Wet land is one of the dangers of a sheep farm, and although some owners make a practice of feeding off the water meadows in the spring, there is little doubt that the wisest plan is to keep the sheep away altogether from every field in which there is a suspicion of exceptional wetness. For the same reason, undrained land is best avoided, unless it is composed of soil which needs no draining, such as gravel.

Rape is an excellent food upon which to fold the ewes at the time of mating. Where ewes are in poor condition, it is better to deter turning in the rams for a week or two until they have had time to recover.—Jas. Long.

If defeated in a show ring remain a gentleman. There is a future at which time one can get revenge in a good honest competitive way. Fairs were established with a view toward educating and it is by having numerous products and picking out the good from the bad that interested people can learn. Someone must have relatively better hogs than others so that it is no disgrace to be defeated. Human beings sometimes make mistakes and when they act as judges this may happen, but it will not happen continuously. If you know your methods of breeding hogs are correct follow them; if not, maybe the judge's opinion may be of assistance to you. Exhibitors as well as visitors may learn.

Amatite
ROOFING



Why Practical Men Demand Amatite

ROOFING that needs paint every two years can't hold the market against Amatite—which *needs no paint whatever.*

Practical men know the great advantage of a roof that *needs no painting.* They know what a nuisance the painting is. They know how much it costs. They know how liable they are to neglect to paint their roofs at the proper time.

Painted roofings are waterproof only where the paint is. Amatite is waterproof all the way through.

Amatite is sold in the usual convenient rolls of 110 square feet with a smooth lap where the mineral surface is omitted, so as to secure a tight joint. Nails and cement are packed in the center of each roll.

Free sample and booklet on request to nearest office.

THE HORSE.

Feeding Farm Work Horses

Some practical tests in feeding farm work horses have been completed by the Illinois experiment station and the results are published in Bulletin 150. The experiments were planned by R. C. Obrecht with ten pairs of horses ranging in weight from 1,003 to 1,560 pounds. Most of the tests were done with seven pairs of horses. The plan was to give one horse in each pair one ration and his mate another. In some cases the rations were reversed after a time so as to give a check on the individual differences of the horses. The horses were mostly grade Percheron geldings and were used steadily at ordinary farm work, each pair always being worked together.

The first test was made to compare timothy and clover hay as the exclusive roughage for horses, and it continued twelve months. The grain ration, as in most of the other tests, consisted of equal amounts of corn and oats with something less than a pound each per day of oilmeal and bran. The second test extended for five months, as in most of the others, and was made to test the value of chaffing about one half of the hay and mixing it with the grain. Another test was made to compare clover and alfalfa hay when each was fed with an equal amount of timothy. Another test compared alfalfa with timothy hay, and still another compared a ration of corn and alfalfa with one of mixed grain with timothy and alfalfa. One test compared whole and ground grains. The conclusions drawn from these extensive tests are thus summarized in the bulletin:

"Where a mixed grain ration of corn, oats, oilmeal and bran is fed, clover hay is equally as efficient if not a little superior to timothy for horses at hard work. There is no observable difference in the effect of clover and timothy upon the spirit of the horses or their ability to endure hot weather. Those receiving clover had a glossier coat of hair and their bowels were looser, but not too loose to endure hard work. When clover is used as horse feed, the quality should be good and the quantity fed limited.

"A slight saving in grain may be made by mingling it with chaffed hay, but the saving in this test did not appear to be enough to justify the expense. There may be a benefit not shown in these tests, in preserving the horse's health, by mingling the grain with chaffed hay. The results of this test are not conclusive on this point. Where the grain was ground and mingled with chaffed clover and with chaffed alfalfa, the lat ter proved to be a little more efficient in preventing loss in weight of horses at hard work. The mingling of grain with chaffed timothy hay did not prove satisfactory.

"Where alfalfa hay is fed as the roughage part of a ration for farm horses at hard work, less grain is necessary to prevent them from losing weight than where timothy hay is fed. In this test there was a saving of about 22 per cent. of grain. Though too short to be conclusive these tests indicate that mature horses at hard work can be maintained quite satisfactorily for a short time at least on corn fed in conjunction with alfalfa hay, and at a saving in cost.

"A saving of about 10 per cent. may be made by grinding the grain for farm work horses when at hard labor. It requires twice as long for horses to consume ground grain fed dry, as when the same quantity is fed thoroughly dampened.

"Farm work horses at hard labor should receive from 1.2 to 1.33 pounds of grain and from 1 to 1.25 pounds of hay per 100 pounds of live weight per day in order that their weight may be maintained. Satisfactory results have been secured by feeding the grain in three equal feeds, and giving one-half the hay at night, the other half being divided between the morning and noon feeds. The grain fed should be reduced one-half on idle days until four days have elapsed, or until they are again put to work, when it may be again increased if desirable. By following this method attacks of azoturia were prevented.

"The results of the experiment indicate that the general impression is correct that horses may very properly be given a more bulky ration when idle or doing light work than when at heavy work. It is believed that the practice of permitting work horses to gorge themselves with hay is all too common."

Unsoundness and Heredity.

Most of the states that have stallions laws classify certain unsoundnesses as heritable, and will not permit stallions possessed of such unsoundnesses to stand for service. Many writers have drawn a sharp theoretical distinction as to the heritability of such conditions, and have spoken of a predisposition to the disease as the thing inherited. A careful consideration of the physiology of many unsoundnesses shows that both of these contentions are wrong in their extreme theory, unless predisposition is a remarkably elastic word. It also shows why it will never be possible to totally remove unsoundness because it is neither in, nor outside of, the heriditary constitution of any animal.

When a man works in the hot sun, the skin of the body adapts itself to the man's needs and forms much more pigment, tanning the man, as it is called. When a horse is trained for the race track, its muscle power adapts itself in a certain way to meet racing conditions. When a hog recovers from hog cholera, there is found in its blood certain antitoxins, which the blood has formed to adapt itself to and repulse the choleric conditions. And so it is in the case of curb. When a horse with a weakly supported hock forms this unsoundness under strains beyond its strength it simply follows the laws of adaptation illustrated in the preceding examples.

This law of adaptation has been a vital one in the development of every species. Those individuals that can most readily meet adverse conditions with an effective response, are the ones that will survive and be the leaders of their race. Thus a definite method of response has come to meet certain conditions.

Let us return to the example of the curb. We say there are two kinds of curb, one associated with a normal conformation, which is not an unsoundness, and one found with insufficiently supported or sickle hocks, which is always an unsoundness. Why distinguish between the two? Both are results of the same process, both have come about under more or less severe strains that have passed the limit of strength of the hock. Both are attempts to make up for this lack of strength by increasing the bearing surface of the joint. It is true that by so doing they stiffen the action of the horse, but strange as it may seem to one who looks on unsoundness as a disease, the hock with the curb is actually stronger than it was before the curb was formed. This does not mean that the horse is necessarily stronger, but simply that the joint itself is. The horse's action and activity may be so interfered with that the added strength of the hock may not be compensated for.

What is true of curb is true of spavin, ringbone and sidebone. Eye, wind and puffed unsoundnesses scarcely fall in the same class, but the bone unsoundnesses are merely dan-

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.
W. A. C. RANDALL, M. D.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable
(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

POULTRY.

Functions of Comb on Poultry.

Sometime ago the Maine experiment station received a letter in whirh inquiries were made as to the proper functions of comb and wattles of fowls, their influence, if any, on the vigor and prepotency of the breeding stock, and also as to whether it was possible in any way to measure or test the physical endurance of the fowl and its capacity in respect to heart and lung action. These questions are of general interest to all poultrymen. The following discussion of them has been prepared by the biologist of the station:

The comb and wattles of poultry are what are known to the biologist as secondary sexual characters. It is quite certain that neithe r the combs nor wattles serve any useful physiological function. That is to say, a bird from which these structures have been removed is quite as healthy and lives as long and is fully as able to perform all its vital functions as a bird which possesses them. They are in some degree, however, and in a manner which is not yet fully understood, connected or correlated with the primary sexual organs. Further proof of this has recently been furnished by the work of an English biologist who shows that throughout the life of a hen every period of laying is preceded by an enlargement of the comb. This enlargement is due to an adtual growth of tissue in the comb substance. The enlargement in many cases is not marked and can only be detected by very accurate measurements.

The fact that the comb and wattles diminish in size and become pale in color during periods of physiological depression, such as molt or in various diseases, finds its physiological explanation in the considerations which have been advanced above. These organs, being in the nature of non-essential excresences or ornaments, with a very considerable blood supply when the bird is in health and vigor, it stands to reason that when that vigor is diminished for one reason or another, the supply of blood and nutriment to the tissues of these organs will be diminished in order that it may be diverted to other more vital parts. The reduction of the comb in size and color during periods of depression is physiologically comparable with the fact that a person when ill is usually pale. This means that the supply of blood to the skin is smaller than in condition of health and vigor.

A large comb does not necessarily indicate strong constitution. In the first place it must be recognized that comb size in part depends upon the breed. The most vigorous specimens of some breeds have by nature and inheritance relatively small combs as compared with other birds. While it is practically always true that a bird with a comb relatively small in proportion to the size normal for its breed is a weak and worthless bird, The converse is not always true. That is to say, some weak, poor specimens will have large combs. The size and condition of the comb should be taken as only one indication along with a whole series of others in judging the constitutional vigor ol a bird. Simply selecting large-combed birds, regardless ol everything else, would not result in a strong vigorous strain.

So far as is known no methods have ever been devised for testing the physical endurance of a fowl and its capacity in respect to heart and lung action. The most practical way to judge of these matters is by feeling the shape and size of the thorax or chest in which these vital organs are contained. This can be judged best from the shape of the back of a bird, much better than from the shape of the breast, which is ordinarily examined in this connection. The bird of high constitutional vigor will have a broad back, which as the hand passes forward over the thorax will feel relatively flat. Furthermore, the taper of the body as one passes the hand forward along the back from the hips to the shoulders will be gradual and not sudden. The more nearly the back walls and chest walls conform to the shape of a good beef type steer—that is, with broad flat back and ribs well sprung—the more certain can one be that it will have well developed heart and lungs and high constitutional vigor.

Getting Eggs Ready for Shipment.

A prominent English shipper of breeding eggs thus briefly describes her methods of getting eggs ready for shipment to her customers:

"All eggs as collected are marked and stored in special trays. On shipping days these eggs are carefully packed in bran and in special boxes; these boxes again are packed in hampers with hay, so no shaking or jar is possible, and abroken egg is unknown. Last year we shipped 2,000 in this way and not a broken egg reported. We avoid shipping during a severe frost, preferring to risk delay than to have the eggs come to hand frosted—the result, a poor hatch. From every pen six eggs must be left on the place, and these, as soon as the orders are dispatched, are paced in the incubator and tested for fertility, the eggs from each pen being specially marked. If the eggs from any pen show a falling off to a 70 per cent. fertility, that pen is checked off the export list until its fertility tests up to the right mark again. By this plan we save the waste of time in shipping many infertile eggs. Three extra eggs with every dozen are put in with every order. We fix it so that any order can be supplied from two unrelated pens, as we keep four pens of each grade. Now and then the most careful of us will find a disatisfied customer, but those who have their customers' interest at heart and work to the principle of doing the right way will find but few complaining customers."—Ida M. Shepler.

Strictly Fresh Eggs.

Why is there such a difference between the price of eggs when they leave the farmers hands and when they are bought by the consumer! Well, every farmer can get good prices if he cares to work for them. The middlemen aren't all sharks." Such is the opinion of A. G. Gilbert, poultry manager of the experimental farm, Ottawa.

There is a strong feeling that the farmers aren't getting a square deal in the marketing of their produce, and especially of their eggs. When these are selling for, perhaps 30 cents at country points, they bring 60 cts. in city reatil stores. Hence the cry that the middlemen make the profit, which the farmers do the work. The middlemen do make large profits, but they are not alone responsible for these conditions. So long as the average farmer handles and markets his eggs as he now does, just so long will he receive low prices and small profits.

The egg that can be guaranteed to be strictly fresh, of a delicious flavor, with the germ undeveloped or still better to be germless and with a pale yellow yolk will always command a high price. But this is just exactly the kind of an egg that few general farmers are producing. With just a little more care—a little more attention to details—the great majority of farmers could produce this high class quality of egg that would command a high class price and return a large profit.

The hens must be in a healthy condition. And to be healthy they must have sufficient exercise, plenty of airspace, and good cleanly food. They must be kept in clean, bright quarters, and given a grass run, if possible. Don't forget your stock will respond to good care, and proper conditions quite as well as will a a man. Don't compel poultry to live in a place you dislike to enter.

But after a healthy, well-flavored egg has been produced, the next thing is to get it to the consumer in this condition. This point cannot be too strongly emphasized. The germ was placed in the egg to eventually reproduce a chicken. The processes of nature are continually working, and the only way to prevent second-grade eggs is to market them at once. They should be sent by express, or by the most convenient method that ensures safe handling, directly to the market. As soon as his reputation is established as supplying only the best, purchasers can readily be found to take the farmer's produce at the very highest prices.

Cases have been known when chickens have been fed foul, but highly stimulating foods, to increase the egg output. Other cases are known where farmers have kept their eggs for many days, even for weeks, until they had a sufficient quantity to "pay them to go to town." Needless to say such conditions must entirely change before high prices will be realized. Those who bewail the inequality of the distribution of wealth had better make very sure that none of the fault is with themselves.—Citizen.

Buy I H C Wagons for True Economy

YOU cannot farm without a wagon any more than you can keep house without a stove. It is something you need every day. You work it harder than anything else on the farm, and when the old one wears out you have to get a new one at once.

Figure out how many bushels of corn, wheat, or oats, or how many bales of cotton it takes to keep you in wagons, and then see how much you save when you buy a wagon that lasts longer than the average.

It is an easy thing to do, even though all wagons which are painted alike look alike. The difference in wagons is underneath the paint. It is the material and workmanship, as well as the paint of I H C wagons

Petrolia **Chatham**

which make them the best wagon investment for any farmer.

We tell you plainly what material goes into every part of our wagons, and we want every purchaser to convince himself before buying, that when I H C wagons are advertised as having birch hubs, maple axles, and long leaf yellow pine box bottoms, these are the materials actually used.

Such care is taken in the construction of the I H C wagons, and in the culling of the materials which go into them, that when a wagon reaches a farmer's barn, that farmer has one of the best wearing, easiest running farm wagons that skilled labor can make or that money can buy. There is no need to speculate in buying a wagon. Wear and tear and length of service are the points to go by. I H C wagons are made for nation-wide uses, with special features adapted to local conditions. Wherever sold they are right, and ready for use in that locality. The I H C wagon agent in your town sells the wagon best suited to your neighborhood. Ask him to go over the wagons with you. Ask him for I H C wagon literature, or write the nearest branch house.

STORY OF A WEED.

A little seed lay in the ground
And soon began to sprout.
"Now which of all the flowers around,"
It mused, "shall I come out?"

"The lily's face is fair and proud,
But Just a trifle cold;
The rose, I think, is rather loud,
And, then, it's fashion's old.

"The violet is very well,
But not a flower I'd choose;
Nor yet the Canterbury bell—
I never cared for blues.

"Petunias are far too bright,
And vulgar flowers, besides;
The primrose only blooms at night,
And peonies spread too wide."

And so it criticised each flower,
This supercilious seed;
Until it woke one summer hour...
...And found itself a weed.—Selected.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

"I am all in a tremble," faltered my mother. "I don't know what's the matter. I shall die I am sure!"

"No, no, no," said Miss Betsy. "It's nothing but fancy. What do you call your girl?"

"I don't know that it will be a girl, yet, ma'am," said my mother innocently.

"Bless the baby!" exclaimed Miss Betsy, unconsciously quoting the second sentiment of the pincushion in the drawer upstairs, but applying it to my mother instead of me, "I don't mean that. I mean your servant."

"Peggotty," said my mother.

"Peggotty!" repeated Miss Betsy, with some indignation. "Do you mean to say, child, that any human being has gone into a Christian church, and got herself named Peggotty?"

"It's her surname," said my mother, faintly. "Mr. Copperfield called her by it, because her Christian name was the same as mine."

"Here, Peggotty!" cried Miss Betsy, opening the parlor door. "Tea Your mistress is a little unwell. Don't dawdle."

Having issued this mandate with as much potentienty as if she had been a recognized authority in the house ever since it had been a house, and having looked out to confront the amazed Peggotty coming along the passage with a candle at the sound of a strange voice, Miss Betsy shut the door again, and sat down as before; with her feet on the fender, the skirt of her dress tucked up, and her hands folded on one knee.

"You were speaking about its being a girl," said Miss Betsy. I have no doubt it will be a girl. I have a presentiment that it must be a girl. Now child, from the moment of the birth of this girl—"

"Perhaps boy," my mother took the liberty of putting in.

"I tell you that I have a presentiment that it must be a girl," returned Miss Betsy. "Don't contradict. From the moment of this girl's birth, child, I intend to be her friend. I intend to be her godmother, and I beg of you to call her Betsy Trotwood Copperfield. There must be no mistakes in life with this Betsy Trotwood. There must be no trifling with her affections, poor dear. She must be well brought up, and well guarded from reposing any foolish confidences where they are not deserved. I must make that my care."

There was a twitch of Miss Betsy's head, after each of these sentences, as if her own old wrongs were working within her, and she repressed any plainer reference to them by strong constraint. So my mother suspected, at least, as she observed her by the low glimmer of the fire: too much scared by Miss Betsy, too uneasy in herself, and too subdued and bewildered altogether, to observe anything very clearly, or to know what to say.

"And was David good to you, child?" asked Miss Betsy, when she had been silent for a little while, and these motions of her head had gradually ceased. "Were you comfortable together?"

"We were very happy," said my mother. "Mr. Copperfield was only too good to me."

"What, he spoiled you, I suppose?" returned Miss Betsy.

"For being quite alone and dependent on myself in this rough world again, yes, I fear he did indeed," sobbed my mother.

"Well! Don't cry! said Miss Betsy. "You were not equally matched, child—if any two people can be equally matched—and so I asked the question. You were an orphan wern't you?"

"Yes."

"And a governess?"

"I was a nursery governess in a family where Mr. Copperfield came to visit. Mr. Copperfield was very kind to me, and took a great deal of notice of me, and paid me a good deal of attention, and at last proposed to me. And I accepted him. And so we were married," said my mother simply.

"Ha ! Poor baby!" mused Miss Betsy, with her frown still bent upon the fire. "Do you know anything?"

"I beg your pardon, ma'am," faltered my mother.

"About keeping house, for instance," said Miss Betsy.

"Not much, I fear," returned my mother. "Not so much as I could wish. But Mr. Copperfield was teaching me—"

("Much he knew about it himself!") said Miss Betsy in a parenthesis.

—"And I hope I should have improved, being very anxious to learn, and he very patient to teach, if the great misfortune of his death"—my mother broke down again here, and could get no farther.

"Well, well!" said Miss Betsy.

—"I kept my housekeeping book regularly, and balanced it with Mr. Copperfield every night," cried my mother in another burst of distress, and breaking down again.

"Well, well!" said Miss Betsy. Don't cry any more."

—"And I am sure we never had a word of difference respecting it, except when Mr. Copperfield objected to my threes and fives being too much like each other, or to my putting curly tails to my seven and nines," resumed my mother in another burst, and breaking down again.

"You'll make yourself ill," said Miss Betsy, "and you know that will not be good either for you or my god-daughter. Come! You mustn't do it!"

This argument had some share in quieting my mother, though her increasing disposition had perhaps a larger one. There was an interval of silence, only broken by Miss Betsy's occasionally ejaculating "Ha!" as she sat with her feet upon the fender.

"David had bought an annuity for himself with his money, I know," said she, by and by. "What did he do for you?"

"Mr. Copperfield," said my mothet, answering with some difficulty, "was so considerate and good as to secure the reversion of part of it to me."

"How much)" asked Miss Betsy.

"A hundred and five pounds a year," said my mother.

"He might have done worse," said my aunt.

The word was appropriate to the moment. My mother was so much worse that Peggotty, coming in with the teaboard and candles, and seeing at a glance how ill she was,—as Miss Betsy might have done sooner if there had been light enough—,conveyed her up stairs to her own room with all speed; and immediately dispatched Ham Peggotty, her nephew, who had been for some days past secreted in the house, unknown to my mother, as a special messenger in case of emergency, to fetch the nurse and doctor.

Those allied powers were considerably astonished, when they arrived within a few minutes of each other, to find an unknown lady of protentous appearance sitting before the fire, with her bonnet tied over her left arm, stopping her ears with jeweller's cotton. Peggotty knowing nothing about her, and my mother saying nothing about her, she was quite a mystery in the parlour; and the fact of her having a magazine of jeweller's cotton in her pocket, and sticking the article in her ears in that way, did not detract from the solemnity of her presence.

The doctor having been up stairs and come down again, and having satisfied himself, I suppose, that there was a probability of this unknown lady and himself having to sit there, face to face, for some hours, laid himself out to be polite and social. He was the meekest of his sex, the mildest of little men. He sidled in and out of the room, to take up the less space. He walked as softly as the Ghost in Hamlet, and more slowly. He carried his head on one side, partly in modest depreciation of himself, partly in modest propitiation of everybody else. It is nothing to say that he hadn't a word to throw at a dog. He couldn't have thrown a word at a mad dog. He might have offered him one gently, or half a one, or a fragment of one; for he spoke as slowly as he walked;but he wouldn't have been rude to him, and he couldn't have been quick with him, for any earthly consideration.

Mr. Chillip, looking mildly at my aunt with his head on one side, and making her a little bow, said, in allusion to the jewellers' cotton as he softly touched his left ear;

"Some local irration, ma'am?"

"What!" replied my aunt, pulling the cotton out of one ear like a cork.

Mr. Chillip was so alarmed by her abruptness—as he told my mother afterwards—that it was a mercy he didn't lose his presence of mind. But he repeated sweetly:

"Some local irration, ma'am?"

"Nonsense!" replied my aunt, and corked herself again, at one blow.

Mr. Chillip could do nothing after this, but sit and look at her feebly, as she sat and looked at the fire, until he was gone upstairs again. After some quarter of an hour's absence, he returned.

"Well!" said my aunt, taking the cotton out of the ear nearest to him.

"Well, ma'am," returned Mr. Chillip, "we are—we are progressing slowly, ma'am."

"Ba—a—ah!" said my aunt, with a perfect shake on the contemptuous interjection. And corked herself as before.

Really—really—as Mr. Chillip told my mother, he was almost shocked. But he sat and looked at her, notwithstanding, for nearly two hours, as she sat looking at the fire until he was again called out. After another absence he again returned.

"Well?" said my aunt, taking out the cotton on that side again.

"Well, ma'am," returned Mr. Chil-

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

TORONTO WOMAN WELL AGAIN

Freed From Bearing Down Pains, Backache and Pain in Side by Lydia E. Pinkham's Compound.

Toronto, Ont.—"Last October, I wrote to you for advice as I was completely run down, had bearing down sensation in the lower part of bowels, backache, and pain in the side. I also suffered terribly from gas. I took Lydia E. Pinkham's VegetableCompound and am now entirely free from pain in back and bowels and am stronger in every way. I recommend Lydia E. Pinkham's Compound highly to all expectant mothers."—Mrs. E. WANDBY, 92 Logan Avenue, Toronto, Ontario.

Consider Well This Advice.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for nearly forty years proved to be a most valuable tonic and invigorator of the female organism. Women residing in almost every city and town in the United States bear willing testimony to the wonderful virtue of Lydia E. Pinkham's Vegetable Compound.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E.Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

Minard's Liniment Co., Limited.

Dear Sirs,—I had a bleeding tumor on my face for a long time and tried a number of remedies without any good results. I was advised to try MINARD'S LINIMENT, and after using several bottles it made a complete cure, and it healed all up and disappeared altogether.

David Henderson.

Belleisle Station, Kings Co., N. B., Sept. 17, 1904.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

A Lame, Sore, Blemished Horse

can be made clean and sound with

ABSORBINE

The Antiseptic "Liniment"

It is the safest, surest and most economical liniment I know of.

ABSORBINE is scientifically and carefully compounded of the best ingredients I can buy. Each ingredient has its particular known work to do and it is put there for a specific purpose. Careful analysis by the Emerson Laboratory. Analytical and Industrial Chemists, conclusively prove its antiseptic and germicidal properties. although containing no minerals or poisons.

This means that ABSORBINE applied to an open sore or wound, not only makes it asceptically clean, but **kills the germs** and causes a healthy healing. This is why ABSORBINE is so successful in **Poll Evil, Fistula, Quittor, Wire Cuts,** etc. No danger of infection or proud flesh formations where ABSORBINE is used.

Especially if your horse is a valuable one it is necessary that you use ABSORBINE, as you surely cannot afford to experiment with blisters, "hit-or-miss" or toxic liniments. That is one reason why trainers with breeders of high-grade stock use ABSORBINE exclusively.

The discutient and resolvent properties of ABSORBINE are positive, which accounts for the promptness and certainty with which this liniment permanently removes soft and calloused bunches wherever they may be located.

ABSORBINE is very penetrating and soothing, consequently **stops lameness** promptly and **allays pain.**

Nothwithstanding its powerful results, ABSORBINE is a mild and pleasant remedy to use, **does not blister, stain or remove the hair,** and horse can be used.

It is economical as only a few drops full strength are required at an application. A bottle of ABSORBINE diluted as per formula on label. makes three gallons of efficient liniment at a cost of 80 cents a gallon.

A twenty-year record of results makes ABSORBINE the remedy for you to use in removing **Bog Spavin, Thoroughpin, Puffs, Shoe Boils, Capped Hocks, Swollen Glands, Infiltrated Parts, Thickened Tissues, Rheumatic Deposits, Enlarged Veins, Painful Swellings** and Affections: to cure any strain or lameness. to repair strained ruptured tendons, ligrments or muscles, to strengthen any part that needs it.

Reprint from Laboratory Report Made November 15, 1911, by A. R. Pyne, M. B., Dominion Analyst, 134 Carlton Street, Toronto, on Absorbine, Jr.

Test 1 was conducted with a 25 per cent. aqueous solution of Absorbine Jr. There was no growth of the Bacillus Diphtheria or Bacillus Coli on the sterile agar plates from one up to fifteen minutes. and nine minutes' exposure was germicidal to the Staphylococcus.

Test 2 was conducted in the same way with a 15 per cent. solution. There was no growth on the agar plates from the Bacillus Diphtheria or the Bacillus Coli, fourteen minutes proving sufficient for the death of the Staphylococcus.

Test 3 was similarly conducted, using a 10 per cent. solution. Three minutes' exposure to this solution was germicidal to the Bacillus Coli, while it took seven to destroy the Bacillus Diphtheria.

You can buy ABSORBINE at regular dealers, price $2.00 per bottle, or sent to you, express prepaid, with full instructions. BOOK FREE.

lip, "we are-we are progressing slowly, ma'am."

"Ya—a—ah!" said my aunt. With such a snarl at him, that Mr. Chillip absolutely could not bear it. It was really calculated to break his spirit, he said afterwards. He preferred to go and sit upon the stairs, in the dark and a strong draught, until he was again sent for.

Ham Peggotty, who went to the national school, and was a very dragon at his catechism, and who may therefore be regarded as a credible witness, reported next day, that happening to peep in at the parlor door an hour after this, he was instantly descried by Miss Betsy, then walking to an :'ro in a state of agitation, and pounced upon him before he could make his escape. That there were now occasional sounds of feet and voices overhead which he inferred the cotton did not exclude, from the circumstances of his evidently being clutched by the lady as a victim on whom to expend her superabundant agitation when the sounds were loudest. That, marching him constantly up and down by the collar, (as if he had been taking too much laudanum), she, at those times, shook him, rumpled his hair, made light of his linen, stopped his ear as if she confounded them with her own, and otherwise touzled and maltreated him. This was in part confirmed by his aunt, who saw him at half-past twelve o'clock, soon after his release, and affirmed that he was then as red as I was.

The mild Mr. Chillip could not possibly bear malice at such a time, if at any time. He sidled into the parlor as soon as he was at liberty, and said to my aunt in his meekest manner:

"Well, ma'am, I am happy to congratulate you."

"What upon?" said my aunt, sharply.

Mr. Chillip was fluttered again, by the extreme severity of my aunt's manner; so he made her a little bow, and gave her a little smile, to mollify her.

"Mercy on the man, what's he doing?" cried my aunt, impatiently. "Can't he speak?"

"Be calm, my dear ma'am," said Mr. Chillip, in his softest accents. "There is no longer any occasion for uneasiness, ma'am, Be calm."

It has since been considered almost a miracle that my aunt didn't shake him, and shake what he had to say out of him. She only shook her own head at him, but in a way that made him quail.

"Well, ma'am," resumed Mr. Chillip, as soon as he had courage, "I am happy to congratulate you. All is now over, ma'am, and well over."

During the five minutes or so that Mr. Chillip devoted to the delivery of this oration, my aunt eyed him narrowly.

"How is she?" said my aunt, folding her arms with her bonnet still tied on one of them.

"Well, ma'am, she will soon be quite comfortable, I hope, returned Mr. Chillip. "Quite as comfortable as we can expect a young mother to be, under these melancholy domestic circumstances. There cannot be any objection to your seeing her presently, ma'am. It may do her good.

"And she. How is she?" said my aunt, sharply.

Mr. Chillip laid his head a little more on one side, and looked at my aunt like an amiable bird.

"The baby," said my aunt. "How is she?"

"Ma'am," returned Mr. Chillip, "I apprehended you had known. It's a boy."

My aunt said never a word, but took her bonnet by the strings, in the manner of a sling, aimed a blow at Mr. Chillip's head with it, put it on bent, walked out, and never came back. She vanished like a discontented fairy; or like one of those supernatural beings whom it was popularly supposed I was entitled to see; and never came back any more.

No. I lay in my basket, and my mother lay in her bed; but Betsy Trotwood Copperfield was forever in the land of dreams and shadows, the tremendous region whence I had so lately travelled; and the light upon the window of our room shone out upon the earthly bourne of all such travellers, and the mound above the ashes and the dust that once was he, without whom I had never been.

CHAPTER II.

I Observe.

The first objects that assume a distinct presence before me, as I look far back, into the blank of my infancy, are my mother with her pretty hair and youthful shape, and Peggotty, with no shape at all, and eyes so dark that they seemed to darken their whole neighborhood in her face, and cheeks and arms so hard and red that I wondered the birds didn't peck her in preference to apples.

I believe I can remember these two at a little distance apart, dwarfed to my sight by stooping down or kneeling on the floor, and I going unsteadily from the one to the other. I have an impression on my mind which I cannot distinguish from actual remembrance, of the touch of Peggotty's forefinger as she used to hold it out to me, and of its being roughened by needle work, like a pocket nutmeg-grater.

This may be fancy, but I think the memory of most of us can go farther back in numbers of very young children to be quite wonderful for its closeness and accuracy. Indeed, I think that most grown men who are remarkable in this respect, may with greater propriety be said not to have lost the faculty, than to have acquired it; the rather, as I generally observe such men to retain a certain freshness, and gentleness, and capacity of being pleased, which are also an inheritance they have preserved from their childhood,

I might have a misgiving that I am "meandering" in stopping to say this, but that it brings me to remark that I build these conclusions, in part upon my own experience of myself; and if it should appear from anything I may set down in this narrative that I was a child of close observation, or that as a man I have a strong memory of my childhood, I undoubtedly lay claim to both of these characteristics.

Looking back, as I was saying, into the blank of my infancy, the first objects I can remember as standing out by themselves from a confusion of things, are my mother and Peggotty. What else do I remember? Let me see.

There comes out of the cloud, our house—not knew to me, but quite familiar, in its earliest remembrance. On the ground-floor is Peggotty's kitchen, opening into a back yard; with a pigeon-house on a pole, in the centre, without any pigeons in it; a great dog-kennel in a corner, without

An article that has real merit should in time become popular. That such is the case with Chamberlain's Cough Remedy has been attested by many dealers. Here is one of them. H. W. Hendrickson, Ohio Falls, Ind., writes, "Chamberlain's Cough Remedy is the best for coughs, colds and croup, and is my best seller." For sale by all dealers.

3

any dog; and a quantity of fowls that look terribly tall to me, walking about, in a menacing and ferocious manner. There is one cock who gets upon a post to crow, and seems to take particular notice of me as I look at him through the kitchen window, who makes me shiver, he is so fierce. Of the geese outside the side-gate who come waddling after me with their long necks stretched out when I go that way, I dream at night; as a man environed by wild beasts might dream of lions.

Here is a long passage—what an enormous perspective I make of it!—leading from Peggotty's kitchen to the front-door. A dark store-room opens out of it, and that is a place to be run past at night; for I don't know what may be among those tubs and jars and old tea-chests, when there is nobody in there with a dimly burning light, letting a mouldy air come out at the door, in which there is the smell of soap, pickles, pepper, candles and coffee, all at one whiff. Then there are the two parlors; the parlor in which we sit of an evening, my mother and I and Peggotty—for Peggotty is quite our companion, when her work is done and we are alone—and the best parlor where we sit on a Sunday; grandly, but not so comfortably. There is something of a doleful air about that room to me, for Peggotty has told me—I don't know when, but apparently ages ago—about my father's funeral, and the company having their black coats put on. On Sunday night my mother reads to Peggotty and me in there, how Lazarus was raised up from the dead. And I am so frightened that they are afterwards obliged to take me out off to bed, and show me the quiet churchyard out of the bedroom window, with the dead all lying in their graves at rest, below the solemn moon.

There is nothing half so green that I know anywhere, as the grass of that churchyard; nothing half so shady as the trees; nothing half so quiet as its tombstones. The sheep are feeding there, when I kneel up, early in the morning, in my little bed in a closet within my mother's room, to look out at it; and I see the red light shining on the sun-dial and think within myself, "Is the sun-dial glad, I wonder, that it can tell the time again?"

Here is our new pew in the church. What a high-backed pew! With a window near it, out of which our house can be seen, and is seen many times during the morning's service, by Peggotty, who likes to make herself as sure as she can that it is not being robbed, or is not in flames. But though Peggotty's eye wanders, she is much offended if mine does, and frowns to me, as I stand upon the seat, that I am to look at the clergyman. But I can't always look at him—I know him without that white thing on, and I am afraid of his wondering why I stare so, and perhaps stopping the service to inquire—and what am I to do?It's a dreadful thing to gape, but I must do something. I look at my mother, but she pretends not to see me. I look at a boy in the isle, and he makesfaces at me. I look at the sunlight coming in at the open door through the porch, and there I see a stray sheep—I don,t mean a sinner, but mutton—half making up his mind to come into the church. I feel that if I looked at him any longer, I might be tempted to say something out loud; and what would become of me then? I look up at the monumental tablets on the wall, and try to think of Mr. Bodgers late of this parish, and what the feelings of Mrs. Bodgers must have been, when afflictions sore, long time Mr. Bodgers bore, and physicians were in vain. I wonder whether they called in Mr. Chillip, and he was in vain; and if so, how he liked to be reminded of it once a week. I look from Mr. Chillip, in his Sunday neckcloth, to the pulpit; and think what a good place it would be to play in, and what a castle it would make, with another boy coming up the stairs to attack it, and having the velvet cushion with the tassels thrown down on his head. In time my eyes gradually shut up; and, from seeming to hear the clergyman singing in a drowsy tone in the heat, I hear nothing, until I fall off the seat with a crash, and am taken out, more dead than alive, by Peggotty.

And now I see the outside of our house, with the latticed bed-room windows standing open to let in the sweet-smelling air, and the ragged old rooks' nests still, dangling in the elm trees at the bottom of the front garden. Now I am in the garden at the back, beyond the yard where the empty pigeon-house and dog-kennel are—a very preserve of butterflies, as I remember it, with a high fence, and a gate and padlock; where the fruit clusters on the trees, riper and richer than fruit has ever been since, in any other garden, and where my mother gathers some in a basket, while I stand by, bolting furtive gooseberries, and trying to look unmoved. A great wind rises, and the summer is gone in a moment. We are playing in the winter twilight, dancing about the parlor. When my mother is out of breath and rests herself in an elbow chair, I watch her fingers, and straightening her waist, and nobody knows better than I do that she likes to look so well, and is proud of being so pretty.

That is among my very earlies impressions. That, and a sense that we were both a little afraid of Peggotty, and submitted ourselves in most things to her direction, were among the first opinions—if they may be so called—that I ever derived from what I saw.

Peggotty and I were sitting one night by the parlor fire, alone. I had been reading to Peggotty about crocodiles. I must have read very perspicuously, or the poor soul must have been deeply interested, for I remember she had a cloudy impression, after I had done, that they were a sort of vegetable. I was tired of reading, and deep sleepy; but having leave, as a high treat, to sit up until my mother came home from spending the evening at a neighbor's, I would rather have died upon my post (of course) than have gone to bed. I had reached that stage of sleepiness when Peggotty seemed to grow and swell immensely large. I propped my eyelids open with my two forefingers, and looked perseveringly at her as she sat at work; at the little bit of wax candle she kept for her thread—how old it looked, being so wrinkled in all directions!—at the little house with a thatched roof, where the yard-measure lived; at her work-box with a sliding lid, with a view of St. Paul's Cathedral (with a pink dome) painted on the top; at the brass thimble on her finger; at herself, whom I thought lovely. I felt so sleepy, that I knew if I lost sight of anything, for a moment I was gone.

"Peggotty," says I, suddenly, "were you ever married?"

"Lord, Master Davy," replied Peggotty. "What's put marriage in your head?"

She answered with such a start, that it quite awoke me. And then she stopped in her work, and looked at me, with her needle drawn out to its thread's length.

"But were you ever married, Peggotty?" says I. "You are a very handsome woman, an't you?"

I thought her in a different style from my mother, certainly; but of another school of beauty, I considered her a perfect example. There was a red velvet footstool in the best parlor, on which my mother had painted a nosegay. The ground-work of that stool and Peggotty's complexion appeared to me to be one and the same thing. The stool was smooth, and Peggotty was rough, but that made no difference.

"Me handsome, Davy!" said Peggotty. "Lawk, no, my dear! But what put marriage in your head?"

"I don't know!—You mustn't marry more than one person at a time may you, Peggotty?"

"Certainly not," says Peggotty, with the promptest decision.

"But if you marry a person, and the person dies, why then you may marry another person, mayn't you, Peggotty?"

"You may," says Peggotty, "if you choose, my dear. That's a matter of opinion."

"But what is your opinion, Peggotty?" said I.

I asked her, and looked curiously at her, because she looked so curiously at me.

"My opinion is," said Peggotty, taking her eyes from me, after a little indecision and going on with her work, "that I never was married myself, Master Davy, and that I don't expect to be. That's all I know about the subject.

"You an't cross, I suppose, Peggotty, are you?" said I after sitting quiet for a minute.

I really thought she was, she had been so short with me; but I was quite mistaken: for she laid aside her work (which was a stocking of her own), and opening her arms wide, took my curly head within them, and gave it a good squeeze. I know it was a good squeeze, because, being very plump, whenever she made any little exertion after she was dressed, some of the buttons on the back of her gown flew off. And I recollect two bursting to the opposite side of the parlor, while she was hugging me.

"Now let me hear some more about the Crorkindills," said Peggotty, who was not quite right in the name yet, "for I an't heard half enough."

I couldn't understand why Peggot-

C. R. SMALLWOOD, Sec.-Treas., Charlottetown, P.E.I.

ty looked so queer, or why she was so ready to go back to the crocodiles. However, we returned to those monsters, with fresh wakefulness on my part, and we left their eggs in the sand for the sun to hatch; and we ran away from them, and baffed them by constantly turning, which they were unable to do quickly, on account of their unwieldy make; and we went into the water after them, as natives, and put sharp pieces of timber down their throats; and in short we ran the whole crocodile gaunlet. I did at least; but I had my doubts of Peggotty, who was thoughtfully sticking her needle into various parts of her face and arms all the time.

We had exhausted the crocodiles, and began with the aligators, when the garden-bell rung. We went out to the door; and there was my mother looking unusually pretty, I thought, and with her a gentleman with beautiful black hair and whiskers, who had walked home from the church with us last Sunday.

As my mother stooped down on the threshold to take me in her arms and kiss me, the gentleman said I was a more highly privileged little fellow than a monarch—or something like that; for my later understanding comes, I am sensible, to my aid here.

"What does that mean!" I asked him, over her shoulder. ...

He patted me on the head; but somehow, I didn't like him or his deep voice, and I was jealous that his hand should touch my mother's in touching me—which it did. I put it away as well as I could.

"Oh, Davy!" remonstrated my mother.

"Dear boy!" said the gentleman. "I cannot wonder at his devotion!"

I never saw such a beautilul color on my mother's face before. She gently chid me for being rude; and, keeping me close to her shawl, turned to thank the gentleman for taking so much trouble as to bring her home. She put out her hand to him as she spoke, and, as he met it with his own, she glanced, I thought, at me.

"Let us say 'good night,' my fine boy," said the gentleman, when he bent his head—I saw him!—over my mother's little glove.

"Good night!" said I.

"Come! Let us be the best friends in the world!" said the gentleman, laughing. "Shake hands!"

My right hand was in my mother's left, so I gave him the other.

"Why, that's the wrong hand, Davy!" laughed the gentleman.

My mother drew my right hand forward, but I was resolved, for my former reason, not to give it him, and and I did not. I gave him the other, and he shook it heartily, and said I was a brave fellow, and went away.

At this minute, I see him turn round in the garden, and give us a last look with his ill-omened black eyes, before the door was shut.

Peggotty, who had not said a word or moved a finger, secured the fastenings instantly, and we all went into the parlor. My mother, contrary to her usual habit, instead of coming to the elbow-chair by the fire, remained at the other end of the room, and sat singing to herself.

"Hope you had a pleasant evening, ma'am," said Peggotty, standing as stil' as a barrel in the centre of the room, with a candlestick in her hand.

"Much obliged to you, Peggotty," returned my mother in a cheerful voice, "I have had a very pleasant evening."

"A stranger or so makes an agreeable change," suggested Peggotty.

"A very agreeable change, indeed," returned my mother.

Peggotty continued to stand motionless in the middle of the room, and my mother resuming her singing, I fell asleep, thoagh I was not so sound asleep but that I could hear voices, without hearing what they said. When I half awoke from this comfortable doze, I found Peggotty and my mother both in tears, and both talking. ...

"Not such a one as this, Mr Copperfield wouldn't have liked," said Peggotty. "That I say, and that I swear!"

"Good Heavens!" cried my mother, "you will drive me mad! Was ever any poor girl so ill-used by her servants as I am! Why do I do myself the injustice of calling myself a girl? Have I never been married, Peggotty?"

"God knows you have ma'am," returned Peggotty.

"Then how can you dare," said my mother—"you know I don't mean how can you dare, Peggotty, but how can you have the heart—to make me so uncomfortable and say such bitter things to me, when you are well aware, that I haven't, out of this place, a single friend to turn to?"

"The more the reason," returned Peggotty, "for saying that it won't do. No! That it won't do. No! No price could make it do. No!"—I thought Peggotty would have thrown the candlestick away, she was so emphatic with it.

"How can you be so aggravating," said my mother, shedding more tears than before, "as to talk in such ao unjust manner! How can you go on as if it was all settled and arranged, Peggotty, when I tell you over and over again, you cruel thing, that beyond the commonest civilities nothing has passed! You talk of admiration. What am I to do? If people are so silly as to indulge the sentiment, is it my fault? What am I to do, I ask you) Would you wish me to shave my head and black my face, or disfigure myself with a burn, or a scald, or something of that sort? I dare say you would, Peggotty. I dare say you'd quite enjoy it."

Peggotty seemed to take this aspersion very much to heart, I thought.

(Continued in next issue.)

Bale Your Hay and Sell It

THERE is always a ready market at a good price for baled hay. It occupies only about one-fifth the space of loose hay. It can be handled easily. It prevents waste and it retains its full food value. Many farmers are making hay the big cash crop of their farms, not only because of the high profits it brings at the present market value, but because as a rotation crop it renews the richness of the soil. These farmers make all the profit themselves. They get a price for baled hay which far more than covers the cost of baling. They are able to ship it to the markets where the price is highest. A big majority of these farmers

Use IHC Hay Presses

the only presses on the market today which fill the need of the individual farmer. Like all other I H C machine lines, our hay press line is complete. You can get I H C pull power presses requiring either one or two horses; I H C motor presses using 3, 4, or 6-horse I H C engine. Both styles have three separate bale chamber sizes, 14 x 18 inches, 16 x 18 inches and 17 x 22 inches.

The I H C pull power press has a greater capacity than any other horse press of its size. It is also easier on the horses; the stepover is the lowest and narrowest made and the horses are pulling no load when they cross it. The I H C hay press has an adjustable bale tension which insures compact bales. It is fitted with a roller tucker that turns in all straggling ends, so that the bale is neat and smooth in appearance. The bale chamber is so low that the attendant can tie the bale without walking round the machine.

The I H C motor press consists of a bale chamber and an I H C engine, mounted together on substantial trucks. It is easily moved from place to place, can be backed to the stack or barn and is always ready for work. The engine does not need a man to watch it. Give it a supply of fuel and water and see that it gets plenty of oil and it needs no other attention. There is no danger of fire because there are no flying sparks, nor is there any smoke or soot to interfere with the comfort and efficiency of the workers. The engine is detachable. Two extra wheels, an axle, and a belt pulley are furnished, so that when not baling hay you have a regular portable I H C engine, which can be used the year around to run a small thresher, saw wood, pump water, generate electric light, grind feed, or separate cream or to run any farm machine for which it supplies sufficient power. Two perfect machines in one. Now is the time to get ready for your haying. Make it a big money crop. Call on the I H C local agent in your town or write the nearest branch house for an I H C hay press catalogue.

I H C Service Bureau

The purpose of this Bureau is to furnish, free of charge to all, the best information obtainable on better farming. If you have any worthy questions concerning soils, crops, land drainage, irrigation, fertilizer, etc., make your inquiries specific and send them to I H C Service Bureau, Harvester Building, Chicago, U S A

For the Sake of the Next One.

Why, auntie, I thought you had finished!"

"So I have," returned Aunt Carrie, as with a smile she went on threading her needle. "I am only trying to smooth the way for the next one."

"Who,for instance," questioned Will, curiously.

"Well, suppose that just as father is starting for business tomorrow morning he discovers that he is about to lose a button from his coat, and he can spare only about two minutes in which to have it sewed on. Don't you think that it would be quite a relief for mother to find her needle already threaded?"

Of course, for I shouldn't think one could find that little bit of an eye at all if he were in ahurry. I had a dreadful time the other day when I wanted to mend my ball. I am sure I should have been glad to be your next one then."

"Suppose again, Will, that whoever dropped that piece of wood upon the cellar stairs had stopped to pick it up, remembering that some one else would be coming that way soon. Wouldn't it have been worth while? Just think how poor Bridget has suffered from her fall.

Yes auntie and if I had wiped the water I spilled at dinner-time sister wouldn't have been obliged to change her dress when she was in a hurry to get back to school. But a fellow will have to keep pretty wide-awake to remember every time!"

And, with a thoughtful expression on his boyish face, Will passed out of the house and towards the front gate eating a banana as he went, but apparently engaged in thought. Reaching the pavement, he threw down the banana skin and proceeded on his way; but presently he turned and looked hard at the yellow object lying upon the pavement, and then, quickly retracing his steps, he picked it up and flung it into the road, where no one would be likely to slip upon it. Turing towards the house he saw his aunt watching him from the window, and with a merry laugh he lifted his hat and bowed, while she in turn nodded approvingly.

Flour and Breadmaking.

(Continued from last issue.)

SOME CHEMICAL CHANGES THAT TAKE PLACE IN THE PROCESS OF MAKING BREAD.

The object of making bread is to convert flour into a form in which it is convenient for use, palatable, nutritious, and easily digested. This is accomplished by somewhat separating the particles of flour through the agency of yeast, by moulding the dough into shapes that are convenient to handle, and by baking it when in the raised condition so that the porous structure may be maintainid, in order that when eaten the digestive juices of the body may readily penetrate the mass. Every step in the process of making bread produces changes in the composition of the faw materials, and the baker's success depends upon his ability to control these changes. Some of the more important changes are: (1) the change of insoluble carbohydrates into soluble forms; (2) the fermentation of sugars and the production of carbon dioxide and alcohol; (3) the formation of acids; (4) a change in the solubility of the proteid compounds; and (5) the volatilization or oxidation of some of the fat. These and many other changes take place, and, as some of the products are gases, a loss of materials must result.

The insoluble carbohydrates of flour are composed of starch and small quantities of other substances with which we are less familiar. The soluble forms, which do not exceed .3 to .5 per cent. of the flour, are made up of sugar and dextrin. The amount of germ left in the flour influences the percentage of these soluble substances.

When the flour is made into a dough, diastase, a ferment native to the wheat, probably changes some starch into dextrins and sugars; the acids formed during the fermentation process and the heat of the oven will also account for the formation of

some of these soluble compounds. According to Snyder, not more than 6 or 8 per cent. of the insoluble carbohydrates originally present in the flour are changed in this way, (1). But in addition to these chemical changes, the combined actions involved in the breadmaking process change the physical appearance of the starch cells. Some of them are partially disintegrated, while others are ruptured, thus rendering them more susceptible to the action of the digestive juices.

During the process of fermentation, the yeast changes some of the sugar of the dough into carbon dioxide and alcohol. The free escape of the carbon dioxide gas is prevented by the tenacity of the gluten, and thus it causes the dough to rise. The volatilization of the alcohol by the heat of the oven probably aids in the expansion of the dough; but, apparently most of the alcohol is changed to other compounds, as very little of it can be recovered from the oven and none of it is left in the bread.

Along with the alcohol fermentation, there is also some acid fermentation taking place. The extent of this action probably depends on the purity of the yeast, the temperature of the dough, and the length of time the fermentation is allowed to proceed. The result, of course, of too much acid fermentation is the production of sour bread. The acid, however, does not all remain in the free state, for some of it combines with the insoluble proteids, producing soluble forms. If this action proceeds far enough it may materially alter the size of the loaf by destroying the gluten, and it darkens the colour of the bread. It has been frequently noticed that some flours require a longer period of fermentation than others. Snyder states that probably this is due to the fact that gliadin, the gluey part of the gluten, is more readily acted upon by the acid than the glutenin, and that in these flours the prolonged fermentation causes the acid to dissolve more of the gliadin and thus bring these two constituents into the proper relationship to give the best results.

The influence of breadmaking on the fat has not been fully studied, but it appears to be changed in some way, for not more than about one-half of the fat in the flour can be extracted from the bread made from it. Evidently there has been some change affecting the composition of the fat which has changed its solubility.

The total loss of material in making bread by other than mechanical means has been stated by different investigators to vary from 1.5 to 6 per cent. The loss is made up principally of the volatile products of carbon and nitrogen. One investigator states that "in good breadmaking the losses are equivalent to about 3 pounds per barrel of flour, while with poor breadmaking the losses may exceed 12 pounds per barrel."

INFLUENCE OF TEMPERATURE.

In the yeast discussion, page 15, it was pointed out that one of the most important essentials for the rapid growth of yeast germs was a favourable temperature, and the temperature recommended was 80 degrees F. This means that to secure the best results the dough should be kept at about this temperature during the time the yeast is working. A low temperature—about 10 degrees F. —will suffice when the long fermentation process is allowed, i. e., when the dough is allowed to rise over night. The difficulty in many households is to properly control the temperature. Frequently the dough is made without any definite determination of the temperature of the materials, and it is placed to "rise" where it is hoped the conditions will be satisfactory. The commercial baker does not take any such risks. He determines the temperature of the flour and then makes the water warm enough to raise the whole dough mass to the desired point, and then seeks to control the temperature during the fermentation period. He recognizes that temperature is one of the factors he must control in order that he may get uniform results.

Some years ago butter was made without the use of a thermometer; but, butter makers in the home and factory have long since recognized that they cannot depend upon "feel" to get the correct conditions. There is the same need of the thermometer in breadmaking, and when the breadmaker brings the dough to at least approximately the right temperature to start with, and places the dough to rise where the temperature can be controlled, a great advance will be made in the making of bread in the home. The difficulty has always been that the home breadmaker has no means of controlling the temperature, and has been forced to cover the dough and allow it to stand over or beside a radiator, register or stove, and trust to luck that the temperature required would be maintained. It may become too hot or too cold, but it would not be known unless the baker has sufficient experience to tell from the appearance and feel of the dough, and "luck" is blamed for the failure.

Dough will recover from a very severe chilling if it brought back to the proper temperature and allowed to stand long enough to rise properly. Chilling does not destroy the yeast germs, but it retards their development, and time must be given them to do their work. An experienced baker has an advantage over an inexperienced one in knowing when the dough has risen sufficiently. Too high temperature may destroy the germs altogether and thus prevent the dough rising.

A simple cabinet for controlling temperature during the dough stage has been devised by the Household Economics Department of this College. The cabinet is illustrated in Fig. 8. It is 2 feet 8 inches high, by 2 feet 2 inches broad, by 2 feet deep, outside measurements. The whole is lined with asbestos, and divided into upper and lower compartments. The partition is placed high enough to allow a small coal oil lamp to be placed in the bottom compartment. The lamp is used as a source of heat, and the heat is transmitted through water contained in a shallow covered galvanized iron pan placed in the centre of the partition. The fumes from the lamp are allowed to escape through small holes in the wooden frame below the partition. The top compartment may be used with or without slatted shelves, and may be kept at any desired temperature by raising or lowering the flame of the lamp, thus influencing the temperature of the water, and consequently, that of the compartment. A very small lamp with the wick turned as low as possible is usually sufficient to maintain the temperature at from 70 to 80 degrees F. It is hardly necessary to say that the thermometer should be left in the cabinet and the temperature noted from time to time, and the flame of the lamp so regulated as to give a constant desired temperature.

The cabinet may be made any desired size, and may be so arranged that the top will answer as a kneading board, and pans and other utensils may be kept in it between baking days.

Fig. 9 shows a simple form of cabinet made out of a packing box. The inside is lined with builder's asbestos paper and arranged very much as the one shown in Fig. 8.

By the use of such a cabinet it is possible to maintain the dough throughout the fermentation period at any desired temperature, and thus render it possible to control one of the main sources of worry and uncertainty in breadmaking.

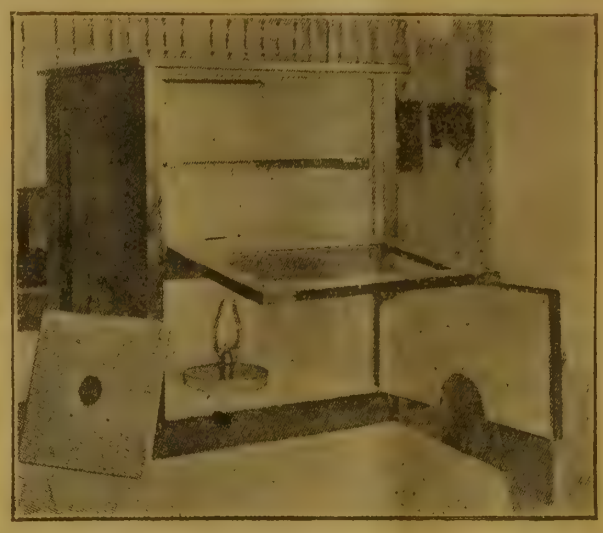

Fig. 8—Cabinet for controlling temperature in bread-making, showing shollow watertank standing at one side.

Fig. 9—Cabinet for controlling temperature in bread-making made out of packing-box.

The asbestos is used to reduce the danger of the case taking fire, if anything happened to the lamp, and also to check and draft through the cracks of the box. If the box is tight, and the danger from the lamp overlooked, there would be no necessity for lining the box.

RHEUMATISM THE CAUSE

DOAN'S KIDNEY PILLS CURED HIM

Mr. W. H. Riley, Ruddell, Sask., writes:—"It is with the greatest of pleasure that I can recommend Doan's Kidney Pills to all suffering with rheumatism. I was so bad with this terrible disease, I was unable to get up from my bed for four months, and nothing seemed to relieve me until a friend recommended Doan's Kidney Pills. I had my doubts about them, but was so desperate I would try anything suggested to me. After taking half a box I was able to get up, and after taking two boxes could get around quite well. After taking six boxes I was completely cured, and able to work for the first time in five months, and have not had a touch of rheumatism since. Anyone who saw me then would not know me now, as I am so strong and active since taking your valuable medicine."

Doan's Kidney Pills are 50 cents per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

In ordering direct, specify "Doan's."

Put T-A Wheels On Your Wagons---

These Wide-Tire Steel Wheels are so constructed that they roll smoothly over the roughest roads without tiring your horses. And they are absolutely accident-proof—yet cheaper than ordinary, wooden wheels.

T-A Wide-Tire Steel Wheels and Handy Farm Wagons

Our Handy Farm Wagons are built low—making them easy to load and unload—and are especially designed to meet the requirements of the man who wants a light, strong wagon for all kinds of work on the farm.

Let us send you our catalogue. It will give you complete information.

To The Public

We beg to announce that we have purchased the good will and interest of the EMPIRE LINIMENT CO. Ltd. and will supply the trade for this excellent Liniment from our factory at Middleton, where all orders should be addressed.

C. GATES SON & CO.

What Says C. H. Purdy, of Bear River, Warden of Digby County, N. S.?

"I was a complete cripple with Rheumatism saw

EMPIRE LINIMENT

advertised and tried it, after every known Liniment and Rheumatic cure. Here I am to-day, sound and well, after using only a few bottles. I recommend it to all sufferers. Don't be without it.

C. H. PURDY.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application, and you will get quick relief. For sale by all dealers.

Proportioning Roofs.

It is not an uncommon sight to see the appearance of a modern barn, completely ruined by an unsightly gambrel roof, which looks as if it was proportioned without a thought being given to harmonious effect.

Strange to say, this assures us that the designer was either careless or inexperienced in building this sort of roof for as soon as we depart from the proper and pleasing proportions for a gambrel roof the structure at once becomes weaker in proportion to the amount of change made so the worse appearing a roof is, the weaker it is.

This is because when this sort of roof was designed all the stresses were calculated and the roof members set at the proper angles to overcome these thrusts and weights; and the laws of gravity required that everything be in proportion and of the same weight in order that one force equalize with the other, thus rendering the whole thing stationary of itself and by the addition of certain members and ties sufficient strength was added to give the required factor of safety. Consequently any change from these principles spoil the appearance and weaken the structure and with a view to remedying these I will tell the readers of the Maritime Farmer how to properly design one of the self-supporting or gambrel roofs.

The first proceeding is to divide the total width of the building over which the roof is to be built, into five equal parts of divisions. These are now taken as spans for the roof; those at each side as the span of the lower slope of the roof and the remaining three centre divisions as the span of the top or centre part of the roof. This gives us the run, or to more clearly explain, the part of the building to be covered by each rafter. When this run has been established it is yet necessary to get another measurement before the length of the rafter can be ascertained, this is called the rise or angle the rafter makes with a horizontal line, and in all gambrel or self-supporting roofs this never changes so it is most important that these angles or rises be remembered.

That for the lower roof is an angle of 56 degrees from the horizontal, or to simplify for farmers or carpenters use, a rise of 18 in. in every foot of horizontal run.

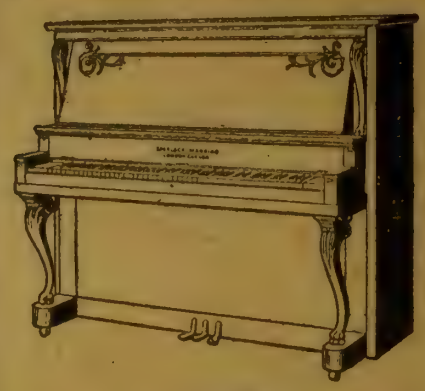
The length is arrived at by erecting a perpendicular from the joints marked for each outside division until it intersects the rafter. This is the point where the lower roof ends and the top roof commences and rises with 34 degrees from the horizontal or 8 in. rise for every foot of horizontal run until the centre of the middle span is reached where those rafters from the other side are encountered and the ridge of the roof is established here....

These measurements when followed out will take the distance from the main plate to the curb and from the curb to the ridge exactly the same and consequently the weights are the same and the incline of the lower roof neatly overcomes any outward foot thrust of the upper rafters, while the design is the prettiest of all roofs and should never be changed. The following drawing of a barn 40 in. wide with a gambrel roof illustrates the idea, and works the same in all sizes of barns.—A. A. G.

Extraordinary Sale of Sherlock-Manning 20th Century Pianos

We have on hand a limited number of **Sherlock-Manning 20th Century Pianos** which we shall offer at

Unusually Attractive Prices--While They Last



Louis XV—Style 80

These pianos are every one brand new—exactly identical with the superb instruments we had at Toronto and London Exhibitions this year.

They were built at the same time as the SPECIAL EXHIBITION Pianos, from carefully selected, beautifully figured veneers—**extra care** having been given each instrument in the way of **special finishing, tuning, etc.**

There is no reason why anyone desiring a really fine piano should be without one longer. Our terms are **easy**, and our prices RIGHT.

Write direct to us for full information and handsome art catalogue.

Sherlock-Manning Piano & Organ Co.
LONDON (No street Address Necessary) Canada

Don't buy a Piano on the Instalment Plan Buy For Cash

Perhaps you may say that this advice is all very well for those fortunate enough to have the means to act upon it. You can buy for cash any piano or organ you wish from any dealer and thus get the advantage of his lowest cash price.

This Is How You Can Do It

When you have made up your mind what and where you are going to buy, just let us know and we will see that you get the instrument at the lowest cash price. If you have not sufficient funds to make up the amount we will supply you with the cash and charge you but 6 per cent. interest, your piano or organ will be our security.
There is not a catch about it anywhere, it's a straight above board business proposition
It will cost you absolutely nothing to get full particulars and you will be under no obligation in doing so either. Every request for particulars and every transaction is altogether free of any kind of publicity.

Canning Vegetables in the Home.

(Continued from page 829.)

following directions. There are several brands of these jars on the market, so no difficulty should be experienced in obtaining them. Vegetables often spoil after being sterilized because of defective rubbers. It is poor economy to buy cheap rubbers or to use them a second time. As a general rule black rubbers are more durable than white ones.

Buy a good grade of jar. The best quality usually retails at from a dollar to a dollar and twenty-five cents a dozen. The initial expense may be, therefore, somewhat high, but with proper care they should last many years. The annual breakage should be less than 3 per cent. on the average. In selecting a jar always give preference to those having wide mouths. In canning whole fruit or vegetables and in cleaning the jars the wide mouth will be found to be decidedly preferable.

CONTAINERS FOR STERILIZING.

The writer uses a tin clothes boiler with a false bottom made of wire netting cut to fit it. The netting is made of medium-sized galvanized wire (No. 16) with one-half inch mesh. A false bottom is absolutely necessary, as the jars will break if set flat upon the bottom of the boiler. Narrow strips of wood, straw, or almost anything of this nature may be used for the purpose, but the wire gauze is clean and convenient.

There are several varieties of patent steamers or steam cookers in common use. These have either one or two doors and hold a dozen or more quart jars. They are ideal for canning, but they are somewhat expensive and can be easily dispensed with. A common ham boiler or clothes boiler with a tight-fitting cover will answer every purpose.

SELECTION AND PREPARATION OF VEGETABLES.

The first step in successful canning is the selection and preparation of the vegetables. Neves attempt to can any vegetable that has matured and commenced to harden or one that has begun to decay. As a general rule, young vegetables are superior in flavor and texture to the more mature ones. This is especially true of string

Confederation Life Building, Toronto, Canada.

SPARKLING WATER, cool and sweet, refreshes the farmer who builds a

Concrete Well or Tank

THE FARMER, above all others, appreciates good water. He drinks more water than the city man. The city-dweller is dependent upon the public water-supply for the purity of his water, while the farmer can have his own private source of water, and thus be sure that it is pure and healthful.

MAN hasn't found a better drink than cool water, properly collected and stored. But in order to keep water fresh and pure, a tank or well casing that will keep out every possible impurity must be used.

CONCRETE IS THE IDEAL MATERIAL FOR TANKS AND WELL-CASINGS.

IT is absolutely water-tight, protecting your water from seepage of all kinds. It cannot rot or crumble. It is easily cleaned inside. Time and water, instead of causing it to decay, actually make it stronger.

THERE are scores of other uses for concrete on your farm—on every farm. If you would like to know of them, write for our book, "What the Farmer Can Do With Concrete." The book is absolutely free.

OUR Farmers' Information Department will help you to decide how to build anything, from a porch-step to a silo. The service is free—you don't even have to promise to build. When in doubt ask the Information Department.

Canada Cement Company

Limited

506-561 HERALD BLDG., MONTREAL

WHEN you go to buy cement be sure that this label is on every bag and barrel. Then you know you are getting the cement that the farmers of Canada have found to be the best.

WHEN THE LIVER IS INACTIVE

CONSTIPATION SOON FOLLOWS

The duty of the liver is to prepare and secrete bile, and serve as a filter to the blood, cleansing it of all impurities and poisons.

Healthy bile in sufficient quantity is Nature's provision to secure regular action of the bowels, and therefore when the liver is inactive, failing to secrete bile in sufficient quantity, constipation soon follows.

Mr. Henry Pearce, Owen Sound, Ont., writes:—"Having been troubled for years with constipation, and trying many so-called remedies, which did me no good whatever, I was persuaded to try Milburn's Laxa-Liver Pills. I have found them most beneficial; they are, indeed, a splendid pill, and I can heartily recommend them to all suffering from constipation."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

The "Bissell"

beans, okra and asparagus. Vegetables are better if gathered in the early morning while the dew is still on them. If it is possible to can them immediately, do not allow them to wither, but put them in cold water or in a cold, damp place to keep them crisp until you are ready for them. Do your canning in a well-swept and well-dusted room. This will tend to reduce the number of spores floating about and lessen the chances of inoculation.

Following are given directions for canning some of the more common vegetables, but the housewife can add to these at will. The principle of sterilization is the same for all meats, fruits and vegetables.

CORN.

Contrary to the general opinion, corn is one of the easiest vegetables to can. The United States Department of Agriculture has shown that the amount of sugar in the sweet varieties diminishes very rapidly after the ear is pulled from the stalk; therefore in order to retain the original sweetness and flavor it is necessary to can corn very soon after it is pulled—within an hour if possible. Select the ears with full grains before they have begun to harden, as this is the period of greatest sugar content. Husk them and brush the silks off with a stiff brush. Shear off the grains with a sharp knife and pack the jar full. Add salt to taste, usually about a teaspoonful to a quart is sufficient, and fill up the jar to the top with coldwater. Put the rubber ring around the neck of the jars, as the steam will top on loasely. Be careful not to press down the spring at the side of the jar.

...Place the false bottom in the boiler and put in as many jars as the boiler will conveniently hold. Don't try to crowd them in. Leave space between them. Pour in about three inches of cold water, or just enough to form steam and to prevent the boiler from going dry during the boiling. It is not necessary to have the water up to the neck of the jars, as the steam will do the cooking. Put the cover on the boiler and set it on the stove. Bring the water to a boil and keep it boiling for one hour. At the end of that time remove the cover of the boiler and allow the steam to escape. Press down the spring at the side of the jar. This clamps on the top and will prevent any outside air from entering. The jars can now be removed and cooled or allowed to stand in the boiler until the next day.

On the second day raise the spring at the side of the jar. This will relieve any pressure from the steam that might accumulate inside the jar during the second cooking. Place the jars again in the boiler and boil for an hour. Clamp on the top as on the preceding day and allow them to cool. Repeat this operation on the third day. In removing the jars from the boiler be careful not to expose them to a draft of cold air while they are hot, as a sudden change of temperature is likely to crack them.

After the sterilization is complete the jars may be set aside for a day or two and then tested. This is done by releasing the spring at the side and picking up the jar by the top. If there has been the least bit of decomposition or if sterilization has not been complete the top will come off. This is because the pressure on top has been relieved by the gas formed by the bacteria. In this case it is always best to empty out the corn and fill up the jar with a fresh supply. If canning fruits or some expensive vegetable, however, examine the contents of the jar and, if the decomposition has not gone far enough to injure the flavor, place it once more in the boiler and sterilize over again. If the top does not come off, you may be suse that the vegetable is keeping.—U. S. Farmers' Bulletin.

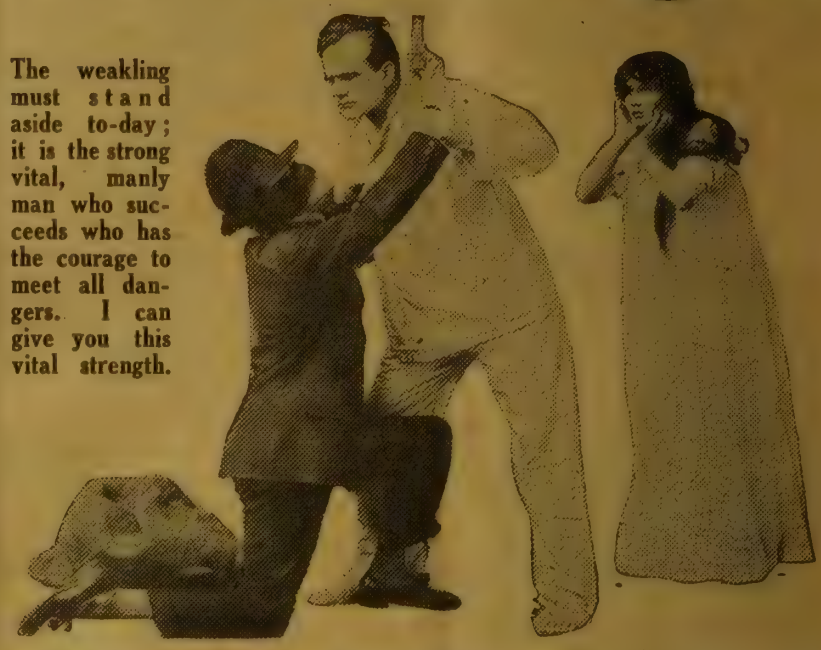
Restores Men To Vital Vigor

The weakling must stand aside to-day; it is the strong vital, manly man who succeeds who has the courage to meet all dangers. I can give you this vital strength.



Vitality is the thing which makes success; it gives men that compelling power which sends them forth eager and equipped to meet and overcome all obstacles; it is the thing which gives our young men courage to face death; it is the thing which inspires and holds a woman's love and faith. No matter what your age, I can give you this same vitality. I can restore the vigor you lost, no matter what early or later indiscretion may have sapped your streagth. I can make you "young" and keep you "young." From an intimate and studious observation of possibly 100,000 weakened men I say to you that vitality or the lack of it means all the difference between a manly man and a half man. The man who bubbles with vital power will exert a pleasing influence upon all with whom he comes in contact; women are naturally attracted to him, as are men. Lack of vitality is a negative condition, and it even repels. You wear my Health Belt and suspensory attachment all night; it sends a great, glowing, health-giving current of electro-vimut into your nerves, blood and organs; it takes all the "kink" out of your back and all the coward out of your makeup; it puts you right up in the "feeling fine" class and keeps you there. No stimulation, no false results; just a sure return to manhood and courage. Recommended also for rheumatism, pain in the back, kidney, liver, stomach and bladder disorders. It makes you feel young and keeps you feeling young forever.

Let Me Send You THIS BOOK Free

Here is my latest illustrated book, "Health In Nature, containing a fund of privrte information relating to weaknesses of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely uo obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

Best collection 5 commercial or export varieties—1, Sea View Farm; 2, H. D. Johnson; 3, Mrs. Wm. Sangster.

Best collection of new varieties—1, H. A. D'Almaine;2, Thos. Aylward; 3, W. S. R. Gow, Grand Pre.

Apiary

Display of Liquid Extract Honey—1, Chas. Piers.

Display of Liquid Clover Honey—1, S. W. Wheelock; 2, Chas. Piers.

Display of Comb Honey—1, Mrs. J. B. Brown.

Five Pounds Beeswax—1, Charles Piers.

—Some time ago we intimated that Col. R. McEwen, Byron, Ontario; C. M. McRae, Live Stock Branch, Department of Agriculture, Ottawa, and Col. H. Montgomery-Campbell, of Sussex, were touring the province in the interest of more and better sheep. The Dominion Sheep Breeders' Association with the co-operation of the Dominion Live Stock Branch, will hold auction sales of pure bred rams and grade ewes at various places in New Brunswicv. The sheep have been carefully selected with a view to stimulating and improving the sheep industry.

The sales will take place at the following points; Moncton, October 7th, 11 a. m.; Sussex, October 8th, 10 a. m.; St. Stephen, October 9th, 2 p. m.; Fredericton, October 10th, 2 p. m.; Bathurst, October 11th, 10 a. m.

FLORICULTURE.

Palms, St. John N. B., writes;—I have a fine palm of the Kentia variety which is growing nicely and is sending forth a new leaf. It is, however, growing up out of the pot so that you can see through the roots under the stems of the palms. We have had to tie it up to a stick. I am advised to repot it. Do you think it should be repotted and what soil should I use?

If the palm is doing well as you state do not repot it until spring, as it is not a good time to do so now All palms of this family grow up rapidly, pushing the plant out of the pot and the appearance of your plant does not at all indicate neglect. Keep it firmly staked so that it cannot break off and it will be all right. When you do repot it use light rich soil and you can cover the roots to the bottom of the stems mentioned.

Rothsay, N. B., Correspondent writes;—Would you kindly tell me how to grow an Aralia Sieboldii whether from seed or not and where they can be obtained? Is there a varigated leaved variety? Are they difficult to grow?

The Aralia Sieboldii is easily grown from seed, which is for sale by leading salesmen. Of course it takes some time to make a plant—possibly two years. The Sieboldii is as easy to grow as a rubber plant and requires much the same treatment. There is a colored variety that grows from cuttings only. I do not know anything about its treatment and do not know the name at present.

H. A. G., of St. John, writes;—Please tell me what to plant and when to plant something that will give me bloom for spring, summer and fall without any care and be a permanent fixture on my grounds?

I would advise Paeonies, Larkspur, Campanulas, Rudbeckias, Acpulegias, Pinks, For-get-me-nots, Iceland Poppies and a dozen of other things named and priced in our catalogue that will be a source of delight for years and practically no trouble as they come season after season, wintering well with a little protection in the fall.

Westfield, writes;—I have a young plant of Spirea Van Houtte. Will it be difficult to keep during the winter?

The Spirea Van Houtte killed somewhat badly last winter, were not well protected, but as last winter was so extraordinarily severe that could hardly be taken as a cirterion, however, it would be wise to protect with some mulch about the roots and brush around the top. It is one of the prettiest hardy shrubs.

Tulip, St. John, writes;—Would you kindly tell me how to plant tulip bulbs so as to give a good effect in the spring, also what protection do they require? I wish to make an oval, bed of four colors in a very conspicuous place.

To make a bed as above mark the shape on the sod and dig out to a depth of six inches. Have the bottom of this excavation smooth and level, then put in an inch of sand, covering the bottom smoothly and evenly, then place the tulips in any pattern desired, pressing them firmly into the sand so that they will not move when putting in the covering soil. Then fill in with good, light, thoroughly rotted soil that does not contain any decaying vegetable matter, which is very injurious to bulbs, and that is free of stones and rubbish of any sort. Firm the soil thoroughly and round up the surface of the bed a little. As soon as the ground freezes, cover the bed with strong manure and put on an outside coating of brush to hold the snow and make the bed more sightly during the winter. There is nothing much prettier than a bed of tulips in spring, blooming when there are no other flowers and lasting so long. Goold, of Sussex, has lots of them ordered for October planting and quantities of other bulbs for ground and house planting.

H. H. D., of St. John, writes;—My palm that was brought from the West Indies is beginning to turn brown at the ends of the leaves. It is in a small tub which stands in a saucer of water. What shall I do for it?

Your palm should not be in a saucer of water, but should be so situated that it would have perfect drainage. Apply the water freely to the foliage at any time but be sparing of moisture on the soil, just keeping it moist but not soaking as you have done, also keep the plant in the shade and in a warm corner if it has not been in this country any length of time.

All tender plants should be potted up now, before any damage of frost, and kept out of doors for some weeks, with a light covering if very cold, until established in their pots; of course the more air and light they get the better they will hold their foliage. Spray them frequently.

Fall is the time to plant Paeonies, hardy plants and vines, in fact all hardy outdoor stock, except Roses. Bulb beds should also be looked after and drainage arranged. About the only thing that will hurt a bulb bed is defective drainage and that is easily arranged if thought of in time. Any questions regarding the culture of flowers addressed to H. E. Goold, Florist, Sussex, N. B., will receive due attention in this column.

An Experimental Farm for New Brunswick.

The Dominion Department for Agriculture has at last seen fit to establish an experimental farm in New Brunswick. A suitable section of farm lands has been purchased in the vicinity of Fredericton and the work of getting it in working order will be started at once. The farm is located on the St. John River, a mile or two below the city of Fredericton, and extends back to the C. P. R. track. There is deep water at the front so that the river boats can make it a landing point. With a C. P. R. station on the rear and prospects of a station on the proposed Valley Railway the farm is favorably located so far as transportation facilities are concerned. The soil conditions are also quite favorable for the research work which will be there conducted. Mr. W. W. Hubbard, Secretary for Agriculture, has resigned his position with the New Brunswick Department and has been appointed Superintendent of the new Experimental Farm. Mr. Hubbard is thoroughly conversant with New Brunswick conditions and will undoubtedly prove an efficient officer in his new capacity.

Pending the appointment of his successor Mr. Hubbard will continue to act as Secretary for Agriculture, a position which he has very satisfactorily filled since he took charge about four years ago.

JOSSELYN & YOUNG.

Fish Fertilizers.

Nova Scotia's plants at Canso and Clark's Harbor for the utilization of dogfish are described at length in recent consular report issued by the United States government. The plants were inspected by U. S. Consul-General James N. Ragsdale, stationed at Halifax. Three plants in all, Mr. Ragsdale writes, were established in 1910 by the fisheries department for testing the feasibility of combating the dogfish nuisance by converting them into commercial products. One of these is located at Shippegan, N. B., the other two at Canso and Clark's Harbor. The one at Shippegan began operation on July 3rd and ceased on November 3rd. During that time 341 tons and 380 pounds of dogfish, as well as 785 tons and 882 pounds of dogfish offel, were treated, and produced 144 tons of fish scrap and 2,000 gallons of oil. The Canso plant began operations on September 14th and continued until the first week in December, during which time 1,000 tons of raw dogfish were treated, yielding 131 tons of fish scrap and 10,560 gallons of oil.

The Kind of a Farm Story Which is all to Common.

Some few weeks ago a certain farmer invited us to visit his place solely to see his garden. We were so impressed with the unusual invitation that we had a curiosity to see what sort ol a farmer he was to be so much concerned over a garden. We were so in the habit of passing farm after farm that hardly had enough of a garden to supply a good-sized family with a week's supply of fresh vegetables, that we thought our invitation would find us being entertained by a host who had everything to show in the way of a garden and nothing in the way of a farm. Our surprise was great, indeed, when we found as well-kept and productive a farm as any in that section. But the garden—it was a dream, a consummation of the spirit of domestic comforts. He was a man who plowed, planted and harvested the crops on a 50-acre farm, and his success was equal to the success of any of his neighbors; but withal he had time or rather found time to take care of as fine a garden as one would care to see anywhere. Our surprise to find such a beautiful garden prompted us to ask many questions. The summary of the answers we received may be stated as follows:

As a boy upon his father's farm, he had been fond of vegetables, but his father was the kind of farmer who thought more of growing hay and corn for the horses and cattle than he did of growing peas and tomatoes for his family. The boy got so tired of pork, potatoes and store beans that he made a firm resolve if he ever owned a farm of his own no amount of work with field crops would deter him from devoting a portion of his time to growing vege tables for the family table. What we saw was the fulfillment of a promise the boy had made to himself over fifty years ago. One sentence he used we shall never forget: "Aside from being a great money-saver life is too short and we over-worked farmers have few enough comforts, to ever think of going through life without all the peas, beans, tomatoes and melons we want; besides, I think one reason why my children have not manifested a desire to run off to the cities is because they have been well fed at home." That sentence is a sermon in itself.—Connecticut Farmer.

Sandy Soils Need Humus.

The addition of vegetable matter to sandy soils is very important as it is needed to increase their water holding capacity as well as to add fertility. Water is often the limiting factor in the production of sandy soils, due to their coarse texture and lack of vegetable matter. To prevent winds blowing sand the land may be laid out in long, narrow fields with alternate grass and cultivated crops. Protection windbreaks of pines or other trees are effective for short distances.

The fertility needs of sandy soil are nitrogen, phosphorus and potash. Phosphorus and potassium must be supplied either directly in commercial fertilizer or indirectly through the buying of feed which is fed to the animals. The average sandy soil contains only one-third to one-half as much fertility as clay loams.

Legumes are beneficial to sandy soils, because they supply the much-needed nitrogen as well as humus. Peat can be used to advantage as a nitrogen fertilizer where a supply is readily available. The use of lime on sandy soils, which are very commonly acid, will aid in securing a stand of alfalfa and clovers. Inoculation is also usually necessary to grow good crops of legumes.

Rotations for sandy soils must be chosen, so as to increase the amount of vegetable matter and provide a legume crop to cover the soil at least once in every three years.

Few, if any, medicines, have met with the uniform success that has attended the use of Chamberlain's Colic, Cholera and Diarrhoea Remedy. The remarkable cures of colic and diarrhoea which it has effected in almost every neighborhood has given it a wide reputation. For sale by all dealers.

We do not need more acres in fruit, but we do need more acres cultivated and managed better. There is too large a per cent of our fruits worthless. Better fruits would mean better prices and less expense in marketing.

BOOK FREE!

Lawndale Stock Farm, I. M. Lovett, M. D., Prop.
YARMOUTH, N. S.

Live Stock Diseases in Canada.

(Continued from page 831)

preventing or very materially limiting losses from the disease.

Rabies has still caused some anxiety in Ontario, where some 436 animals were quarantined as suspects or contacts. No other province has infected during the year, and stringent quarantine and close attention to all cases is bringing about the desired result. It has not, however, been found necessary to put into effect a general muzzling order, as with few exceptions the quarantine restrictions have been properly observed, and in many cases the owners have preferred to destroy their digs to keeping them under restrictions for lengthy periods.

Dr. Seymour Hadwen has been engaged in the work of investigating the nature and cause of Redwater among the cattle in British Columbia, and full details of the result will be found in the Report of the Veterinary Director General. It is gratifying to learn from the results so far obtained that they do not point to piroplasma infection as the causative agent, but that it is more probable the ingestion of some species of plant life growing on uncultivated lands produce the symptoms and lesions found in this disease. Special efforts are also made to collect and identify ticks found in British Columbia, with a view to isolating and obtaining special knowledge regarding those which may play an active part as carriers of infection of disease.—Vet. Dir. Gen. Report.

Unsoundness and Heredity.

(Continued from page 838)

ger signals that show where the breeder has failed.

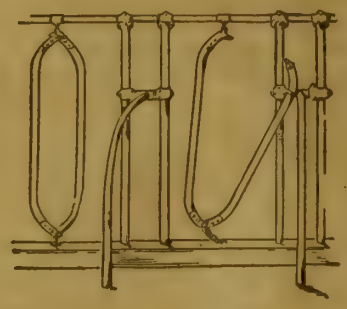
The problem then is not one of breeding this class of unsoundness out of the horses constitution. It is to breed a horse with better mechanical strength due to more perfectly formed joints and heavier bone. It is not that we must select against unsoundness, but that we must select for mechanical efficiency. It is doubtful whether we want to get an animal free from the possibilities of developing spavin, curb and ringbone, because this method of adaptation may permit service from a horse that would be ruined forever when overstrained. What we do want is an animal that has the mechanical strength from an ideal body. The stock judge and breeder is not, as many would have us think, a man expert in finding little blemishes and faults. He is the man who, looking past these, can see the mechanical perfection of everything good.—E. N. Wentworth in Breeders' Gazette.

Hogs in Winter.

During the winter months, when the field work is not pressing, porkmaking furnishes an opportunity to utilize the farm labor to advantage. Where winter dairying is carried on laborers must be constantly maintained to do chores and care for the milk. There are always several hours between milkings when the laborer needs to be otherwise employed. Most large dairymen keep one or two barn hands to do the chores and care for the dairy herd, exclusive of the milking. As the hogs can be fed between the hours in which the herd demands attention, we find that it is very profitable to follow winter porkmaking as an adjunct to the dairy because we can furnish steady employment to the necessary farm labor. It requires only a few minutes for one or two hands to feed 50 or 75 hogs, and this in no way need interfere with their regular work.—Coburn's "Swine in America."

Making Farming Easier

EVERY farmer agrees that it is a fine thing to apply scientific methods to farming, and to run a farm on a business basis. The Louden way is the truly scientific and businesslike way to save labor and to ease the day's work.

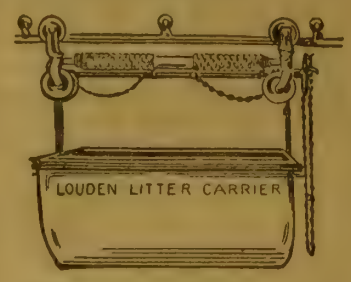


LOUDEN'S COW STALLS AND STANCHIONS keep your cows cleaner and healthier. Therefore the cows give more milk, and this means bigger profits.

Stanchion construction is simple and perfect. Easily opened and closed, but absolutely secure when locked. They allow freedom of movement, and provide a maximum of comfort.

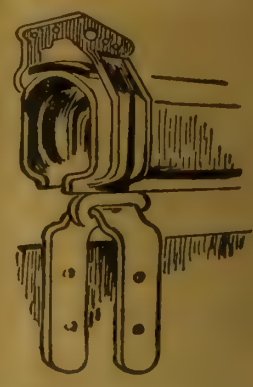
LOUDEN'S FEED AND LITTER CARRIER. The only practical way to handle feed and litter, etc., is by overhead carrier—and the Louden equipment is recognised as being the last word in perfection.

Louden's carriers are of galvanized sheet steel on elevated steel tracks—run anywhere—round corners, in and out of doors—from one building to another.



We have different styles of carriers and we will advise you as to the tracking suitable for your requirements.

Write for information.



LOUDEN'S BARN DOOR HANGERS. We manufacture five styles of hangers to suit different purposes. We recommend Louden's Bird Proof Door Hanger—as illustrated. It is the strongest and most durable, and consequently the cheapest hanger in the long run.

The construction protects these hangers from ice in winter and nesting birds in summer. Can't rust, can't balk. Thoroughly reliable.

THIS BOOK SENT FREE

Our Book, "Perfect Barn Equipments," will be useful to you, as it illustrates and tells about many modern inexpensive articles that turn chores into play and cut down expense of farm labor—write for it to-day, it's free.

LOUDEN MACHINERY CO., Dept. 28 , GUELPH, Ont.

DIRECT FROM FACTORY TO KITCHEN

SAVE OVER $25 WHEN BUYING YOUR RANGE THIS FALL.

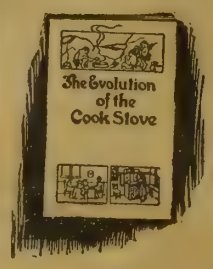
$41.00 TO $49.00 AND WE PAY THE FREIGHT

You Can Buy "DOMINION PRIDE" RANGE At Factory Price

Direct From The Largest Malleable Range Works in Canada

IF you want to save from $25 to $30, and at the same time get the most satisfactory kitchen range made, write for our Catalogue and look into the merits of the "DOMINION PRIDE," at from $41 to $49.

If we sold you identically the same range in the usual way, through a dealer, you would have to pay from $69 to $78 for it. You would be paying two extra profits—to wholesaler and retailer—which would add $25 to $30 to the cost of your range, but absolutely nothing to its value.



"The Evolution of the Cook Stove"

TELLS about cooking from the time the Cave Dwellers dropped hot stones into the pot to boil it. It also tells all about "Dominion Pride" Ranges. Whether you need a Range just now or not you will enjoy reading this book.

Write for Free Copy.

Besides costing much less than other ranges in its class, the "DOMINION PRIDE" is much more satisfactory. It is made of **tough, strong, malleable iron** and the **best blue polished steel**—materials which will not warp, crack or break.

The polished steel does not need blacking—simply rub it over with a cloth. With its cold rolled steel plate oven—sectional iron fire-box lining, with air chambers—and double-walled flues lined with asbestos—the "DOMINION PRIDE" is the most economical range you can buy. Actual tests have proved that it **saves over 30% of fuel**, burning either wood or coal.

WE PAY THE FREIGHT

A "DOMINION PRIDE" Range, with high closet shelf and elevated tank or flush reservoir, with zinc sheet to go under range, 8 sections blue polished steel pipe and two elbows, will be delivered to any station in Ontario, Quebec or the Maritime Provinces for $41, or to any station in the four Western Provinces for $49—$5 to be sent with order and balance to be paid when the Range is delivered at your station. **If not convenient to pay cash we will arrange to accept your note.**

Canada Malleable & Steel Range Mfg. Co., Limited, Oshawa, Ont.

When writing it will be a distinct favor to us if you will mention this paper. 7

EATON'S

"It Took Me Fifty Years to Know How to Give You Better Roofs than any other Man"

"I tell you, every farmer in Canada should realize the big share a good roof has in making a good barn. That is my life-work—making roofs. I have been making my roof better and better for more than fifty years. What I have done for farm roofs is one of the biggest things ever done for people who farm."

"You ask me why a barn roof is so important. I will tell you. You build a barn and expect the roof to protect it many years. You put thousands of dollars' worth of produce under that roof while it lasts. Every pound of this produce costs you hard work. If a poor roof lets it get spoiled by wet, you lose money year after year. This lost money is many times the roof cost. Some roofs will last for several years. Some roofs will last if they are kept painted. But a roof is mighty hard to get at. It is not too safe to work on anyhow. Once a roof starts to leak, it is often left as it is. The result is the things you have in your barn spoil. This is lost money, and soon amounts to more than the cost of a good roof."

A Roof for Any Man

See What a Good Roof Can Do!

"I have spent my life making a low-cost roof that any man or his tinsmith could lay right. This roof of mine saves the stuff stored under it. It saves the barn framing and beams. It saves the foundation. This roof of mine doesn't need special roof timbering at all."

Good for 100 Years

"The big point about my roof is that it cannot develop leaks after you have had it up a year or two. It is a real roof from the first year it is on your barn to the last year. And do you know when that 'last year' will be? You will use that barn, and your son will use that barn, and your grandson will use that barn before that 'last year' comes. I want to pound the fact home to you that when you get a roof from me, you get a roof that is good for one hundred years. Think of getting a roof that makes your barn good for a hundred years. And that at about the price of an ordinary roof."

"That is why I say, 'I have helped the farmer more than any man ever did.' My roof will protect a good $100,000 of produce in your barn in 100 years. A roof that will do that is worth going after a good long ways."

Stands the Arctics

"This roof is so good that the Canadian Government Bernier Arctic Expedition used it for the Arctic regions. Here is immense cold and sweeping winds and ice and poor foundations to stand up under. The North-West Mounted Police use it. The Canadian Government has found no better roof for them. My roof is a good roof for the Arctic Circle. It is a still better roof for milder climates elsewhere."

Stands the Tropics

"But that is not all. My roof is used in the West Indies. Here is a temperature of 135 degrees at Porus, Jamaica. My roof stands it. In Jamaica during rainy season at Montego Bay, rain falls 10 inches in a single day. My roof stands it. In Ontario rain falls 30 inches in a whole year. My roof in Jamaica stands in 24 hours the rainfall it has easily 4 months for in Ontario. Is that a good roof? Is a roof that stands the severe conditions in both Arctics and Tropics good enough for you? You get exactly the same article, made on the same machines."

Used All Over the World

"Not only that, go down to South Africa. Go to the farms there. Go around Port Elizabeth, or Durban, or up in the Transvaal. You'll see my roof there. People will go around the world for my roof, because it is the best roof in the world. It will last 100 years. People use my roof in Japan—an earthquake country. They get it from me. They have searched the world for a roof that would stand earthquake straining. My roof will."

This Took 50 Years

"You are beginning to see something of the big work I have done. I have made a low-cost roof that stands terrific cold and heat, that stands tremendous rains, that stands ice, that stands earthquakes. In fifty years, I have made Pedlar roof better and better by little points added every year. It has world sales to-day, just because it is the best roof in the world at its very moderate price."

MY LATEST TRIUMPH

"Then, a few years ago, I put my finishing touch that made my roof wonderful. I had been troubled, not by my roof design, but by the metal in it. It seemed impossible to get a metal which would not rust. I had to take the best metal I could get. The design was all right. I had been making that design better for fifty years. At last I struck a clew in Europe."

"You know they have cathedrals there that are hundreds of years old. Yet the iron hinges on the doors are as good as ever to-day, though they were hammered out hundreds of years ago. I said to myself, 'Why not make up my roof in this peculiar kind of iron, so my roof will last like those door hinges?' Well, sir, that was a hard job. It was hard to get that iron duplicated. I worked for a long time and my chemists worked with me to get it. I stuck to it just as carefully as I had stuck to bettering my roof. And I got it at last. That's the metal I use to-day."

You Get the Benefit

"My roof is the only roof in the world with this kind of non-rusting iron in it. I am the only man a farmer can come to and say, 'I want a hundred-year roof at about the price I would pay for cedar shingle.' I am the only man that can deliver that kind of goods.

"My roof will not rust to the leaking point within 100 years. It saves the barn and its product from the weather. It saves the barn from thaw-water and lodged ice, because the seams cannot be gouged apart. It saves the barn from fire, because sparks cannot burn it. A burning stick on the roof will not harm it, or harm the barn under it. Lightning cannot burn a barn with my roof on it. My roof is a perfect conductor of electricity. My roof has 'give' in it to defy heat and frost, and protects in winter and summer. It protects even though the rafters sag. Wind cannot blow my roof off a barn. This is because it is a ventilated roof. It keeps your barn ventilated and stands the heaviest winds safely."

Get My Barn Book

"I want to send you my book, 'ROOFING RIGHT.' This lets you dig into more facts about the Pedlar roof. You will see how clean it is. It gives the best cistern water you can gather, as it is self-cleaning. This book shows scores of good barn designs—the best barns in Canada. Every one has my roof on it. You will get big help from my book, and I will send it free for a post-card, because you can plan your barn from it, whether you use my 100-year roof or not."

326

"I am the best friend the farmer has, because I have given him one of the best roofs in the world at a very low cost. I want to send out more of my barn books, because I want to see good barns built. I send a book free to you, if you will ask for it. Write me to-day."
